APPENDICIES

Appendix A	Crash Table
Appendix B	Historical Data
Appendix C	2004 Motorcycle Crash Data

Why study Michigan's motorcycle crashes?

There have been several studies conducted on motorcycle crashes throughout the nation but few, if any, comprehensive studies of Michigan specific crashes. Even though most of the data shows similar trends to Michigan's motorcycle crashes, there is considerable data that differs from what has been learned about motorcycle crashes occurring in this state.

This document is a logical next step to the research paper "Serious Motorcycle Crashes in Michigan." Upon completion of that analysis, it was felt a closer analysis of ALL motorcycle crashes in Michigan was warranted.

The analysis of serious motorcycle crashes reveals those crashes are comparatively similar throughout the three-year period studied. Because of those similarities, it was felt a closer look at all motorcycle crashes that occurred in Michigan for the year 2004 would give an accurate representation of how and why motorcycles crashes occur within this state during the current age.

Most of the data analyzed was supplied by the Criminal Justice Information Center, specifically the Official Traffic Crash Report (UD-10). During this study, 3,495 UD-10s' were analyzed.

Historical and certain comparison data was obtained from the "Michigan Traffic Crash Facts" booklet published by the Office of Highway Safety Planning (OHSP) in conjunction with the University of Michigan Transportation Research Institute (UMTRI). Prior to 1992, the "Michigan Traffic Accident Facts" booklet was compiled and published by the Michigan Department of State Police and OHSP.

The contents of this analysis reflect the views of the author who is responsible for the facts and accuracy of the data presented herein. The contents do not necessarily reflect the views or policies of the Michigan Department of State Police.

A Historical Perspective

Historical data was compiled back to 1962 using the "Michigan Traffic Accident Facts" booklet. Some data was unavailable from 1963 through 1966. As a result, this perspective will concentrate on the years 1966 through 2004.

Chart 1 illustrates the number of registered motor vehicles in Michigan increased from approximately 4.1 million in 1966 to nearly 8.6 million in 2004, an increase of 107% over a 38-year period.

Chart 1: All Motor Vehicle Registrations

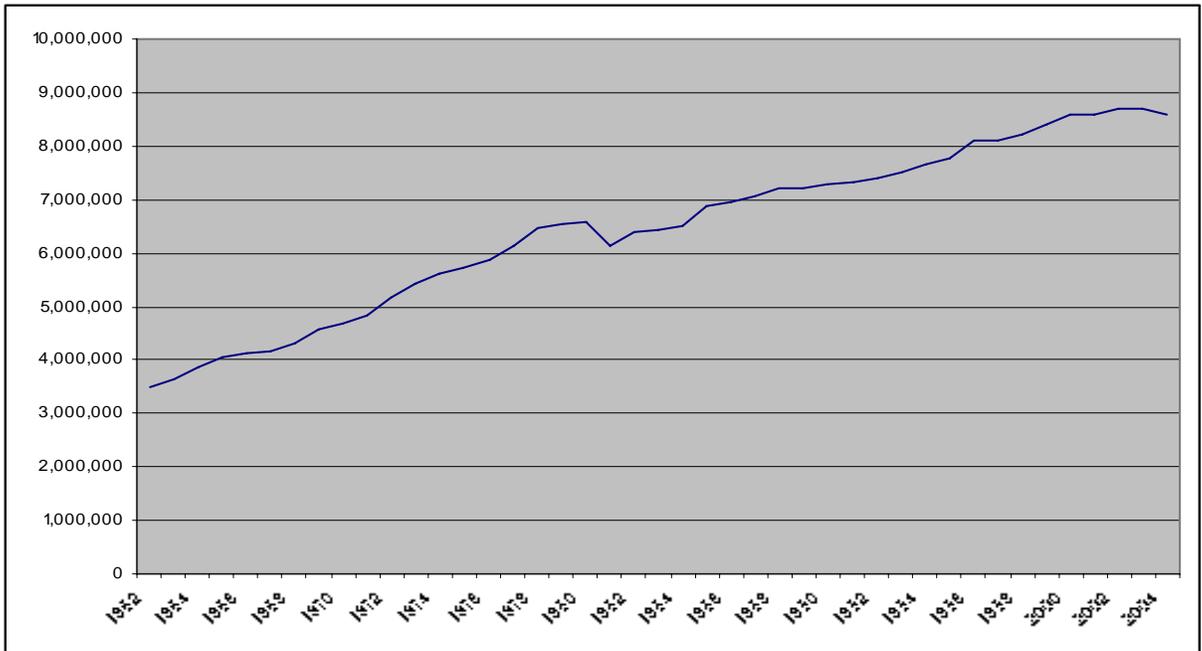

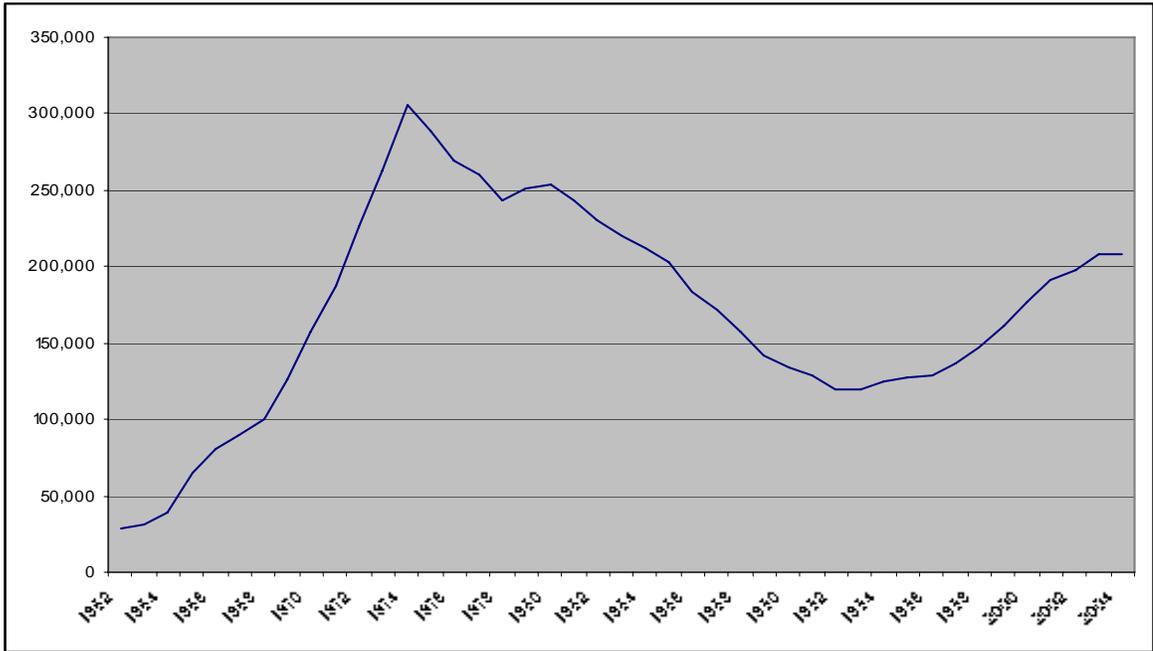

Chart 2 illustrates the number of registered motorcycles in Michigan increased from 81,136 in 1966 to 208,544 in 2004, an increase of 157% over the same 38-year period.

Chart 2: All Motorcycle Registrations

In comparing the number of registered motorcycles to the total number of registered motor vehicles, the data shows motorcycle registrations accounted for 2% of all registered motor vehicles in Michigan in 1966 and 2.4% in 2004. The highest point for motorcycle registrations in Michigan was 306,297 in 1974 when they accounted for 7.4% of all registered vehicles. Michigan also enacted the 55 mph speed limit on interstate freeways in 1974.

Chart 3 illustrates the number of motor vehicle crashes in Michigan increased from 302,880 in 1966 to 373,028 in 2004, an increase of 23% over a 38-year period.

Chart 3: All Motor Vehicle Crashes

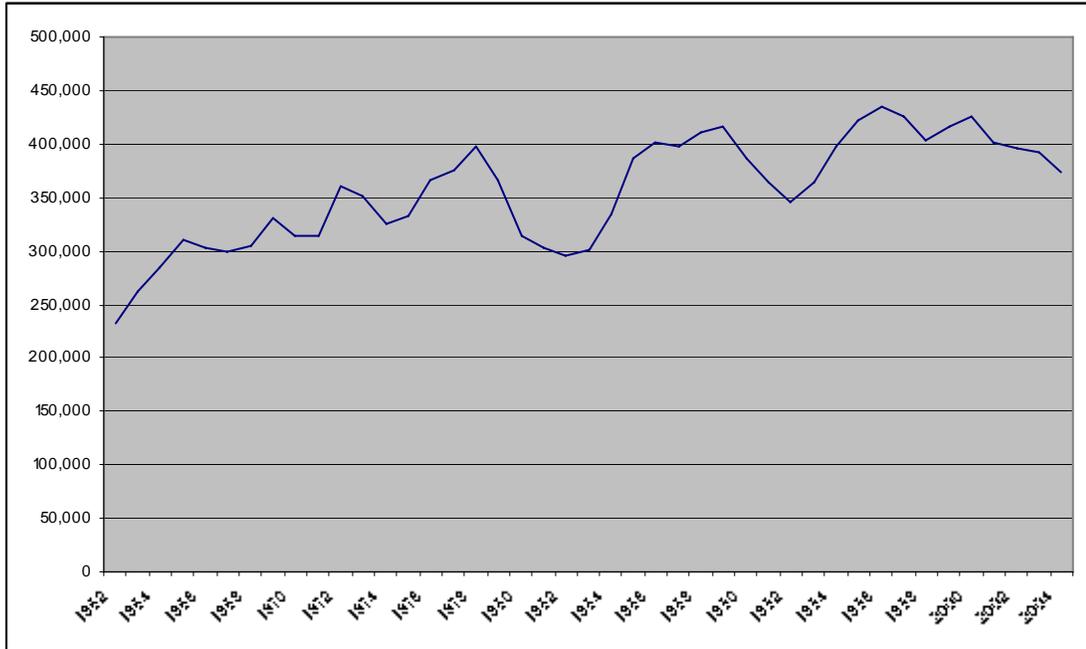

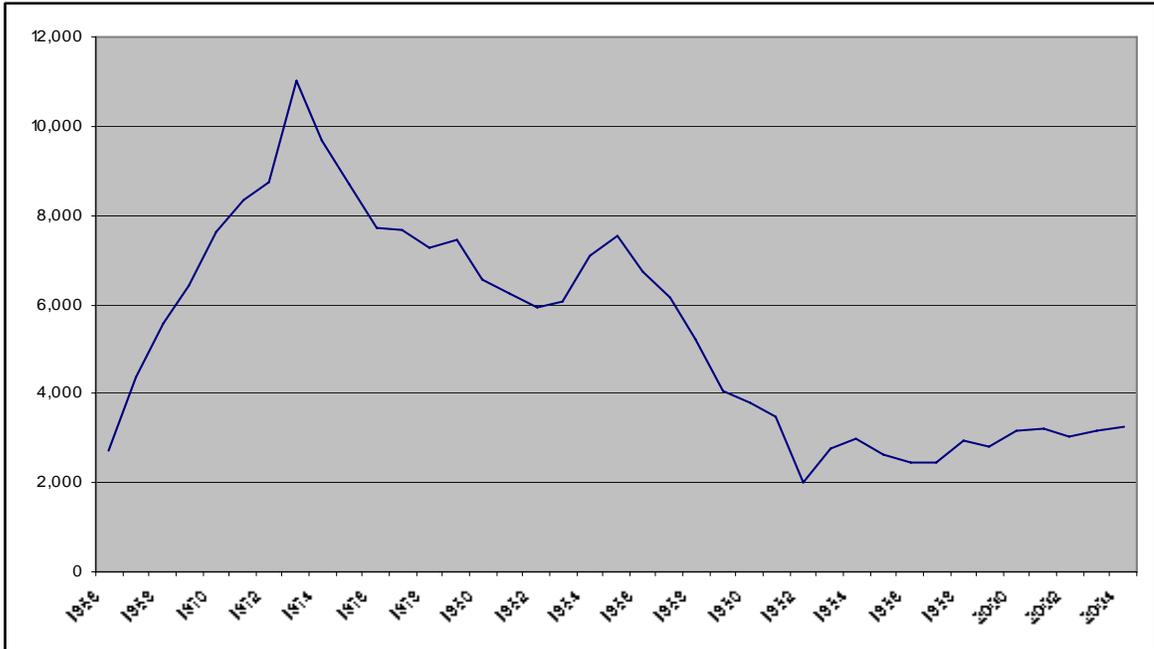

Chart 4 illustrates the number of motorcycle crashes in Michigan increased from 2,723 in 1966 to 3,276 in 2004, an increase of 20% over the same 38-year period.

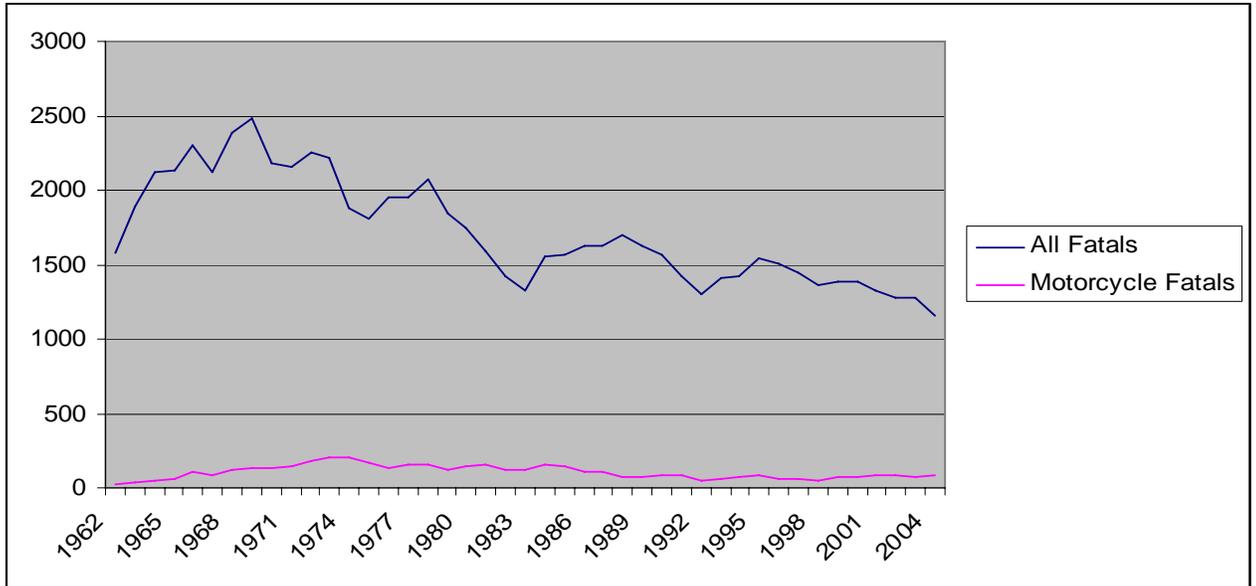

Chart 4: Motorcycle Crashes

There were 11,024 motorcycle crashes in 1973, which represent a 304% increase in 7 years. However, since 1973 the number of motorcycle crashes has declined from this all time high. It should be noted that 1973 was the year the Motorcycle Safety Foundation was established.

Chart 5 illustrates the number of traffic crash fatalities overall and the number of motorcycle fatalities. Michigan recorded 2,296 traffic crash fatalities in 1966, which included 104 motorcycle-related fatalities, and 1,159 traffic crash fatalities in 2004, which included 79 motorcycle-related fatalities. The highest number of reported traffic crash fatalities during the period studied was 2,478 in 1969. The highest number of motorcycle-related fatalities reported during the same period was 209 in 1973.

Chart 5: All Fatalities

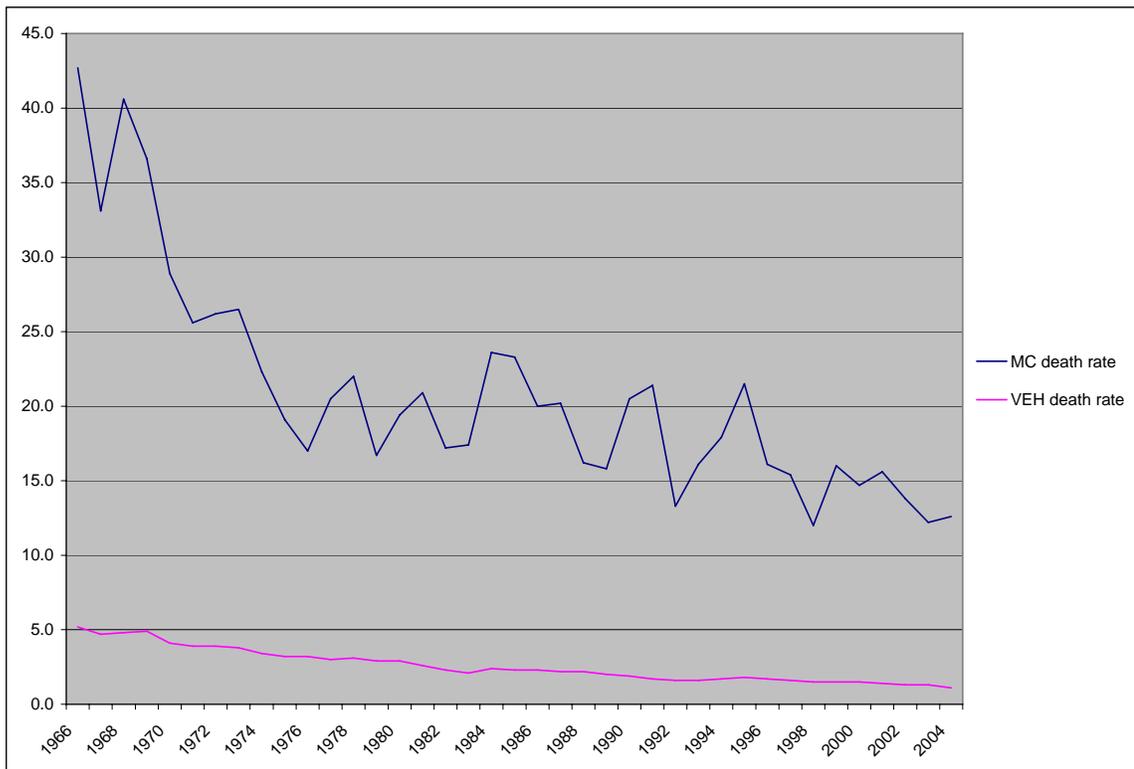

The state of Michigan calculates the overall traffic crash death rate by relating the number of deaths per 100 million miles traveled. Chart 6 illustrates a comparison between overall death rate and the death rate specific to motorcycles. The upper line in the chart represents the death rate for motorcycles, while the lower line represents the rate for all motor vehicles.

The highest rate for motorcycles was recorded in 1966 at 42.7 deaths per 100 million miles traveled, while the rate in 2004 was 12.6.

The highest rate for all vehicle types was also recorded in 1966 at 5.2 deaths per 100 million miles traveled, while the rate in 2004 was 1.1.

Chart 6: Death Rate Comparison

The following is a recap of the data for the period 1966 through 2004:

- Total number of motor vehicle registrations rose 107%
- Highest number of motor vehicle registrations was 8,708,698 in 2003
- Total number of annual motor vehicle crashes rose 23%
- Highest number of annual motor vehicle crashes was 435,477 in 1996
- Motorcycle registrations rose 157%
- Highest number of motorcycle registrations was 306,297 in 1974
- Motorcycles account for 2.4% of all registered motor vehicles
- Number of annual motorcycle crashes rose 20%
- Highest number of annual motorcycle crashes was 11,024 in 1973
- Motorcycle crashes accounted for 0.9% of all motor vehicle crashes in 2004 – the same percentage as in 1966
- Overall number of traffic crash fatalities per year fell by 50%
- Number of motorcycle-related fatalities per year fell by 24%
- Motorcycle fatalities accounted for 4.5% of all traffic crash fatalities in 1966
- Motorcycle fatalities accounted for 6.8% of all traffic crash fatalities in 2004
- Current death rate for all motor vehicles is 1.1 per 100 million miles traveled
- Highest death rate for all motor vehicles was 5.2 in 1966
- Death rate for all motor vehicles has fallen by 78%
- Current death rate for motorcycles is 12.6 per 100 million miles traveled
- Highest death rate for motorcycles was 42.7 in 1966
- Death rate for motorcycles has fallen by 70%

In 1966, the “Michigan Traffic Accident Facts” booklet provided detailed information about motorcycle crashes, which is not found in the 2004 publication. Table 1 shows comparisons between motorcycle crashes in 1966 and 2004.

Table 1: Motorcycle Crash Specific Comparisons

	1966	2004
Crash Type: Top Four Motorcycle Crashes		
Single Motor Vehicle crash	33.7%	47.0%
Angle crash as a % of Multiple-Vehicle crashes	45.4%	36.2%
Rear End crash as a % of Multi-Vehicle crashes	19.2%	27.1%
Sideswipe Same crash as a % of Multi-Vehicle crashes	9.6%	10.9%
Violation or Hazardous Action: Top Three		
Speed too Fast	39.0%	25.8%
Other	14.3%	15.6%
Following too Close or Unable to Stop	13.4%	17.8%
Directional Analysis SMV Crash		
Failed to Negotiate Curve	16.7%	39.7%
Lost Control on Straight Road	31.9%	15.4%
Environmental		
Road Condition – Dry	91.2%	89.8%
Daylight	70.4%	71.6%
At Intersection	39.0%	27.3%

By comparison, the top four crash types remain the same and when combined together account for approximately 80% of the motorcycle crashes in 1966 and 86% in 2004. There were approximately 13% less Single Motor Vehicle crashes in 1966 than in 2004. The top three hazardous actions identified in 1966 are identical to those noted in 2004. In addition, the two most common types of directional analysis are identical even though the percentage of occurrence is reversed. Environmental factors are also nearly identical in that most crashes occurred on dry pavement during daylight hours. Approximately 12% more of the crashes occurred at intersections during 1966 than in 2004.

Today the average age of the motorcyclist involved in a crash is 40. Table 1a compares certain age groups involved in motorcycle crashes to those involved in all crashes.

Table 1a: Age Comparisons

Age Group	All Crash Numbers	% of Total	MC Crash Numbers	% of Total
16 – 24	156,496	26.9%	548	17.8%
25 – 64	380,983	65.5%	2,599	84.2%
65 & older	43,964	7.6%	64	2.1%

Table 1b provides age data supplied by the Michigan Department of State for 2004, which shows the relation to age and overall number of endorsed motorcyclists.

Table 1b: Age Population

Age Group	Numbers of Endorsed Motorcyclists	% of Total
16-17	493	1.0%
16-24	13,626	2.8%
25-34	53,488	10.9%
35-44	119,524	24.5%
45-54	174,673	35.8%
55-64	93,470	19.1%
65 & older	33,281	6.8%

So What or Where is the Problem?

The historical data during the preceding four decades shows an increase in the number of registered motorcycles, vehicle miles traveled, and motorcycle riders; a decrease in the number of traffic crashes and traffic fatalities; and the most frequently occurring types of motorcycle crashes and hazardous actions associated with those crashes has remained the same.

With this information in mind, what or where is the problem? Even though overall traffic crash numbers have increased, fatalities are down and the death rate is lower. The problem is that in terms of what would be considered as a "normal" mode of transportation, not an experimental type vehicle or a professional racing type vehicle, the motorcycle could be easily called the most dangerous type of transportation available and there is no valid reason for this conclusion.

From a scientific standpoint this should not be the case, or at least if it is agreed that the motorcycle, because of its design, is the most dangerous type of transportation, it still should not be AS DANGEROUS as it currently is. Why? Given the environmental conditions where almost 90% of the motorcycle crashes are occurring, dry roads during daylight hours, comparing a motorcycle to passenger or commercial type motor vehicle, the motorcycle is capable of out performing those vehicles in stopping and acceleration ability and maneuverability.

There are many factors that have had a positive effect on lowering the number of traffic crashes. Driver licensing, which was not a requirement years ago, is a requirement today. After the requirement to have a driver license was enacted, a person could legally operate a motorcycle without any other type of license or endorsement. Years later, the motorcycle endorsement was created. Driver education also came along years after the first automobile rolled off the assembly line. Today, Michigan has a graduated licensing system for young drivers; roadways are designed and engineered better; intersections are controlled by signs and/or signals; construction materials have improved and last longer; dirt/gravel roads are fewer; trees and other vision obstructions have been removed or relocated away from critical traffic areas; and the motorcycle has vastly improved through the introduction of components such as tubeless tires, four-stroke engines, fuel injection, anti-lock disk brakes, and even airbags on certain motorcycles available in 2006.

Given all these factors, how can the number of motorcycle crashes be reduced? How can the most dangerous mode of transportation better its reputation? The search for the answer to these questions is the purpose of this analysis.

This study will begin by identifying and then analyzing the typical Michigan motorcycle crash.

What is a Crash?

The Michigan Vehicle Code (MVC) does not provide the definition of a traffic crash, but does define when a person is required to report a crash. "The Michigan criterion for a crash is, did the incident involve a motor vehicle that was in transport, and on the roadway, that resulted in death, injury or property damage of \$1000 or more?" If the answer is yes, it is a reportable crash. In addition, Michigan law requires ALL fatal crashes occurring on public or private property to be reported.

The section entitled "Concept of the Michigan State Police Traffic Crash Report" in the 2004 edition of the UD-10 Traffic Crash Report Instruction Manual states, "...Every reasonable effort shall be made to obtain factual information for the completion of the report. If this is not possible, law enforcement shall use their best judgment and record their considered opinions based on

their investigation and experience. This should be done even though it may not be possible to substantiate all recorded information or have sufficient evidence to initiate prosecution....”

This analysis was targeted specifically at motorcycles in transport on a public roadway, and does not include motorcycles that were parked or crashes that occurred off-road regardless of the seriousness of the crash.

The Michigan State Police Criminal Justice Information Center provided the original data for this analysis. A total of 3,495 entries were identified and screened, and a total of 3,291 crashes were selected for analysis.

Crash Environment

There was very little difference noted between the previous analysis of serious motorcycle crashes and this analysis of all motorcycle crashes with respect to environmental conditions. More than 70% of all motorcycle crashes occur on dry roadways other than freeways, during daylight hours, and away from controlled intersections.

- 71.6% daylight
- 10.8% dark-lighted
- 10.4% dark-unlighted
- 5.2% dusk
- 1.6% dawn

- 70.3% no traffic control

- 13.7% at signaled intersections
- 12.7% at stop signed intersections
- 0.9% at yield signed intersections

- 89.8% dry roads
- 5.5% wet roads
- 1.6% debris on road
- 1.1% other/unknown
- 0.1% muddy roads
- 0.1% snowy/icy roads

- 32.7% on straight roads, non-freeway
- 18.4% on curved roads, non-freeway
- 17.3% within an intersection
- 8.4% at or within 150 feet of a driveway
- 7.0% within 150 feet of an intersection
- 4.9% on a freeway, except entrance/exit ramp
- 4.5% on a freeway entrance/exit ramp

When this data is compared to overall motor vehicle crash data, there are two distinct differences.

The first area where there is a marked difference is road surface condition. In respect to overall traffic crash data, 64.4% occur on dry roads vs. 89.8% for motorcycle crashes. Other published analysis of motorcycle crashes attributes this difference to the fact that motorcycles are “fair weather” vehicles, meaning that they are mainly driven in good weather and on dry roads. Michigan’s motorcycle crashes occur every month of the year, but 94.2% occur from April 1 through October 31. Therefore it is believed that the low incidence of crashes in unfavorable

weather conditions is based more on preference of when to ride as opposed to adjusting driving behavior.

The second area where there is a marked difference is intersection crashes. Data for all traffic crashes indicates that 45.5% occur at intersections. The analysis of motorcycle crashes reveals that only 27.3% occur at intersections.

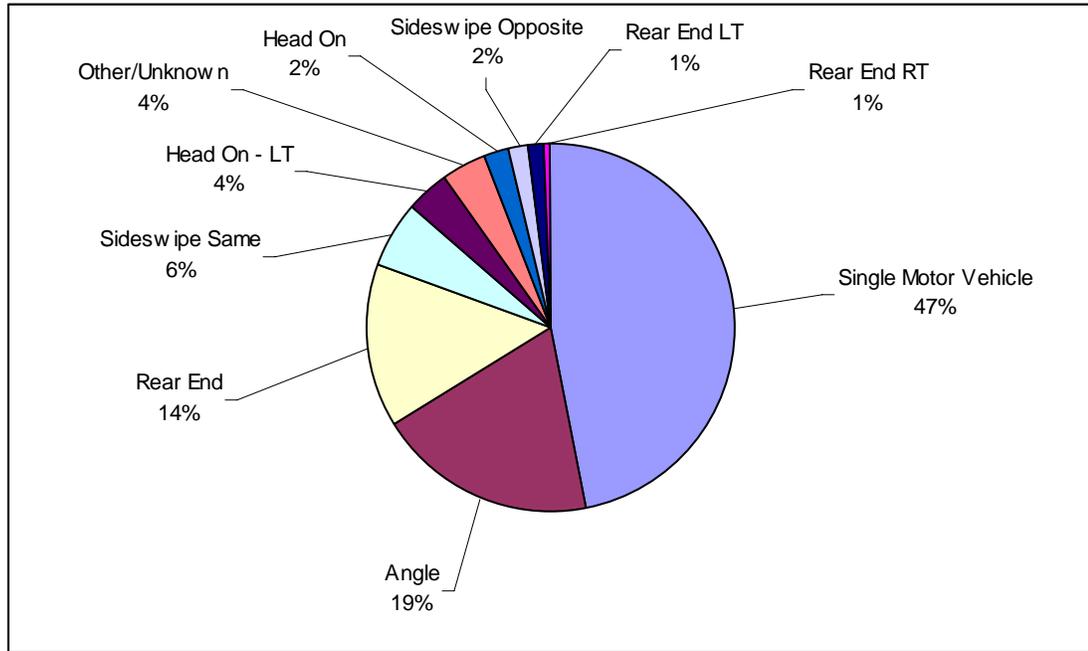

Note that 26.3% of motorcycle crashes occur at controlled intersections. This discrepancy can be attributed to some crashes occurring at intersections that are uncontrolled, meaning there is no signal, stop sign, or yield sign.

The reason for the difference in number of intersection related crashes is the greater percentage of Single Motor Vehicle crashes associated with motorcycle crashes. Overall, 34.4% of all traffic crashes are Single Motor Vehicle crashes, but 47% of motorcycle crashes are Single Motor Vehicle crashes and nearly 80% happen away from controlled intersections.

Crash Type

Chart 7 shows motorcycle crashes categorized by type.

Chart 7: Motorcycle Crash Types

Crash type is based upon the intended direction of travel prior to the crash. To understand motorcycle crashes, the various crash types and their frequency of occurrence must be analyzed. Table 2 shows the breakdown of crash types for motorcycle crashes in Michigan. Crash types have been ranked according to their frequency of occurrence.

Table 2: Crash Types

Crash Type	Number	% of Total
Single Motor Vehicle	1547	47.0%
Angle	632	19.2%
Rear End	472	14.3%
Sideswipe Same Direction	190	5.8%
Head On – Left Turn	133	4.0%
Other/Unknown	127	3.9%
Head On	71	2.2%
Sideswipe Opposite Direction	51	1.5%
Rear End – Left Turn	46	1.4%
Rear End – Right Turn	22	0.7%

Nearly half of all motorcycle crashes are Single Motor Vehicle (SMV) crashes. In 1966, the only historical year with wide ranging motorcycle crash data, 39.5% of reported motorcycle crashes were SMV crashes. As a comparable, only 20.7% of ALL motor vehicle crashes in 1966 were SMV crashes. The historical data for ALL motor vehicle crashes, at least as far back as 1966 shows that SMV crashes account for less than 35% of all traffic crashes.

Single Motor Vehicle crashes are OVERREPRESENTED in motorcycle crashes.

After considering SMV crashes in motorcycle crashes, the remainder can be categorized as Multi-Vehicle (M-V) crashes. M-V motorcycle crashes account for 53% of the total number of reported motorcycle crashes. There are nine crash types in the M-V crash group.

Table 3 illustrates the nine types of M-V motorcycle crashes and their percentage of frequency in relation to all motorcycle crashes and all motor vehicle traffic crashes. Crash types are ranked from most frequent to least frequent as they pertain to motorcycle crashes.

Table 3: Multi-Vehicle Crash Types

Crash Type	% of All Motorcycle Crashes	% of ALL Traffic Crashes
Angle	19.2%	18.9%
Rear End	14.3%	24.4%
Sideswipe Same Direction	5.8%	8.7%
Head On – Left Turn	4.0%	2.6%
Other/Unknown	3.9%	5.0%
Head On	2.2%	1.6%
Sideswipe Opposite Direction	1.5%	2.5%
Rear End – Left Turn	1.4%	1.0%
Rear End – Right Turn	0.7%	0.9%

The Angle crash and Rear End crash, when combined, account for 33.5% of all motorcycle crashes and 43.3% of all motor vehicle traffic crashes.

The two main groups of crashes have been identified as SMV and M-V and can be analyzed according to their respective subgroups. The reason for a separate analysis is that the two main groups of crashes are fundamentally different types of crashes. Factors associated with one are not readily associated with the other.

Single Motor Vehicle Crashes

Nearly 5 out of every 10 motorcycle crashes in Michigan, or 47 out of 100 to be more precise, do not involve a collision with another motor vehicle. The motorcycle may crash on the roadway, leave the roadway and crash, or collide with a train, pedestrian, bicyclist, or an animal. When the motorcycle leaves the roadway it may collide with a tree, rock, guardrail, bridge abutment, or other fixed object. This indicates that nearly half of ALL motorcycle crashes cannot be blamed on the “other” driver because there is no other driver.

Each Single Motor Vehicle (SMV) crash report was studied individually. The “Crash Diagram and Remarks” section of the report was given specific attention due to the limited information available from the coded entries. Through this analysis, a clearer picture can be made of how these crashes are occurring.

Table 4 categorizes the mechanics of the crash and lists them by frequency of occurrence. The data shows that three conditions, failure to negotiate a curve, a collision with an animal, and loss of control on a straight road, are present in over half of all SMV crashes.

Table 4: SMV Remarks

Action	Numbers	% of Total
Failed to Negotiate Curve	395	25.5%
Struck an Animal	255	16.5%
Lost Control on a Straight Road	162	10.5%
Debris/Uneven or Rough Pavement	98	6.3%
Lost Control During a Turn	92	5.9%
Exited the Road on the Right Side	76	4.9%
Swerved to Avoid a Collision	76	4.9%
Laid Down to Avoid a Collision	70	4.5%
Mechanical Failure	49	3.2%
Excessive Speed/Careless/Reckless	42	2.7%
Involved an Animal (Non Contact)	41	2.7%
Exited the Road on the Left Side	39	2.5%
Unable to Stop	35	2.3%
Miscellaneous	33	2.1%
Struck an Object	24	1.6%
Improper Passing	23	1.5%
Fleeing the Police	17	1.1%
Drove Through a T-Intersection	17	1.1%
Failed to Yield	3	0.2%

When fault is factored into these numbers, it presents a slightly different picture of events. Table 5 compares the mechanics of the crash in terms of hazardous action. Actions are ranked by overall frequency of occurrence as in Table 4. This data shows that 92.4% of those that failed to negotiate a curve were found at-fault, 87.7% of those that experienced a loss of control on a straight roadway were found at-fault, and only 3.1% of those that had a collision with an animal were found at-fault.

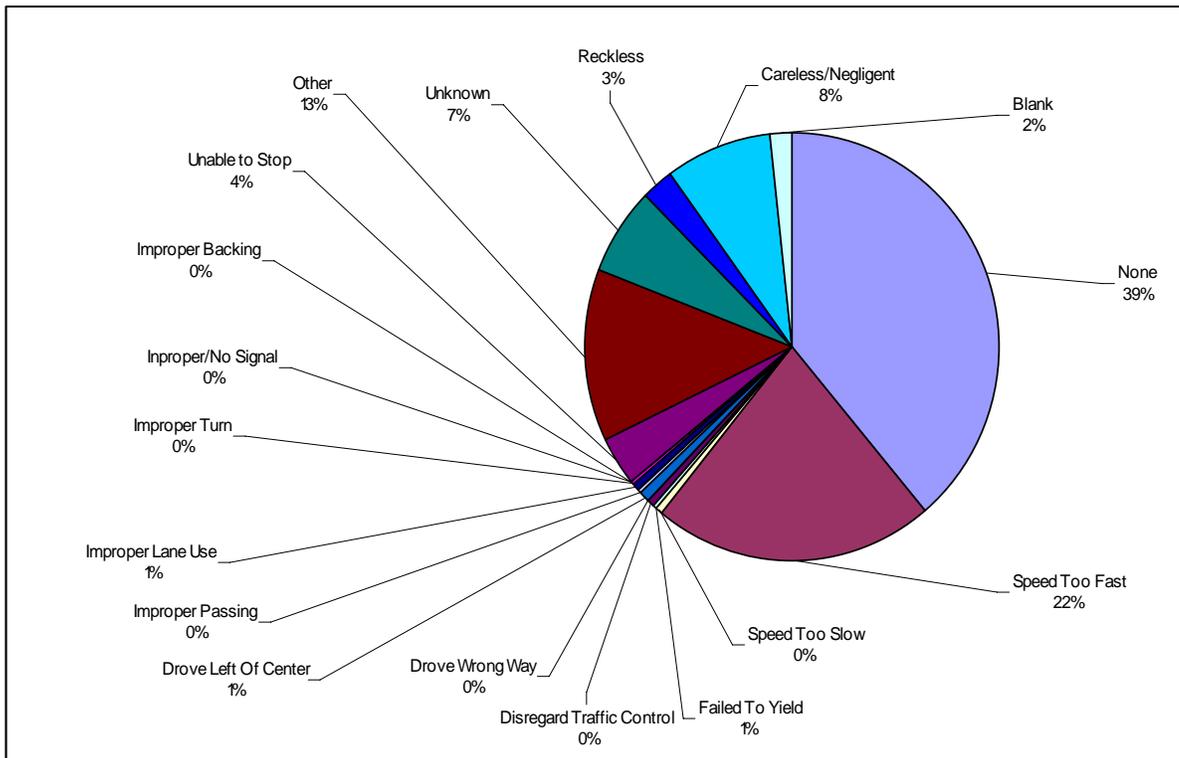

Table 5: SMV Remarks and Fault

Action	Number At-fault	Number Not At-fault
Failed to Negotiate Curve	365	30
Struck an Animal	8	247
Lost Control on a Straight Road	142	20
Debris/Uneven or Rough Pavement	8	90
Lost Control During a Turn	75	17
Exited the Road on the Right Side	68	8
Swerved to Avoid a Collision	13	63
Laid Down to Avoid a Collision	15	55
Mechanical Failure	16	33
Excessive Speed/Careless/Reckless	41	1
Involved an Animal (Non Contact)	13	28
Exited the Road on the Left Side	37	2
Unable to Stop	34	1
Miscellaneous	22	11
Struck an Object	6	18
Improper Passing	22	1
Fleeing the Police	17	0
Drove Through a T-Intersection	17	0
Failed to Yield	1	2

Because information from the Crash Remarks and Diagram section on the UD-10 is not coded, it cannot be compared to these motorcycle crash specific mechanics and those specific mechanics occurring in all motor vehicle crashes. However, a comparison with fault or hazardous action can be made.

The State of Michigan UD-10 Traffic Crash Report Instruction Manual defines a hazardous action as whether "...in the investigating officer's opinion, a person is at-fault in any way...." Chart 8 depicts the hazardous actions associated with SMV motorcycle crashes.

Chart 8: SMV Motorcycle Crash Hazardous Actions

This data reveals that in 39% of SMV motorcycle crashes the operator was not at-fault and 59% were found at-fault to some degree or another. In 2% of the crashes, this code was left blank. Because the “Michigan Traffic Crash Facts” booklet does not show hazardous actions based on specific crash types as this analysis does, a comparison will not be made at this time. Later in the analysis the overall motorcycle crash hazardous actions and those associated with all motor vehicle crashes will be completed.

The following is a recap of what has been discovered about SMV motorcycle crashes:

- 47% of all motorcycle crashes are SMV compared to less than 35% of all motor vehicle traffic crashes that are SMV.
- The three most common factors associated with the SMV motorcycle crash are;
 - Failed to negotiate a curve
 - Collision with an animal
 - Loss of control on a straight road
- 59% of those involved in a SMV motorcycle crash were found at fault to some degree. 50% of all hazardous actions are for one of the following;
 - 22% Speed too fast
 - 13% Other
 - 8% Careless/negligent driving
 - 7% Unknown

Now that a closer look has been taken at SMV motorcycle crashes, it is pertinent to do the same with Multi-Vehicle (M-V) motorcycle crashes.

Multi-Vehicle Crashes

Table 2 identified nine types of Multi-Vehicle (M-V) crashes, which account for 53% of all motorcycle crashes. Table 3 shows the top three M-V crashes are the same with respect to motorcycle crashes vs. all motor vehicle traffic crashes.

The analysis of these crashes will begin by treating M-V crashes as a group independent of SMV crashes. Table 6 shows the nine types of M-V motorcycle crashes and their percentage of occurrence independent of the SMV crashes.

Table 6: Multi-Vehicle Crash

Crash Type	Numbers	% of Multi-Vehicle Crashes
Angle	632	36.2%
Rear End	472	27.1%
Sideswipe Same Direction	190	10.9%
Head On – Left Turn	133	7.6%
Other/Unknown	127	7.3%
Head On	71	4.1%
Sideswipe Opposite Direction	51	2.9%
Rear End – Left Turn	46	2.6%
Rear End – Right Turn	22	1.3%

The Angle, Rear End, and Sideswipe Same Direction crashes account for 74.2% of all M-V motorcycle crashes, while the remaining six types combined account for 25.8%. Because of this disparity, the top three M-V crashes will be analyzed separately and the remaining six will be analyzed as a single group.

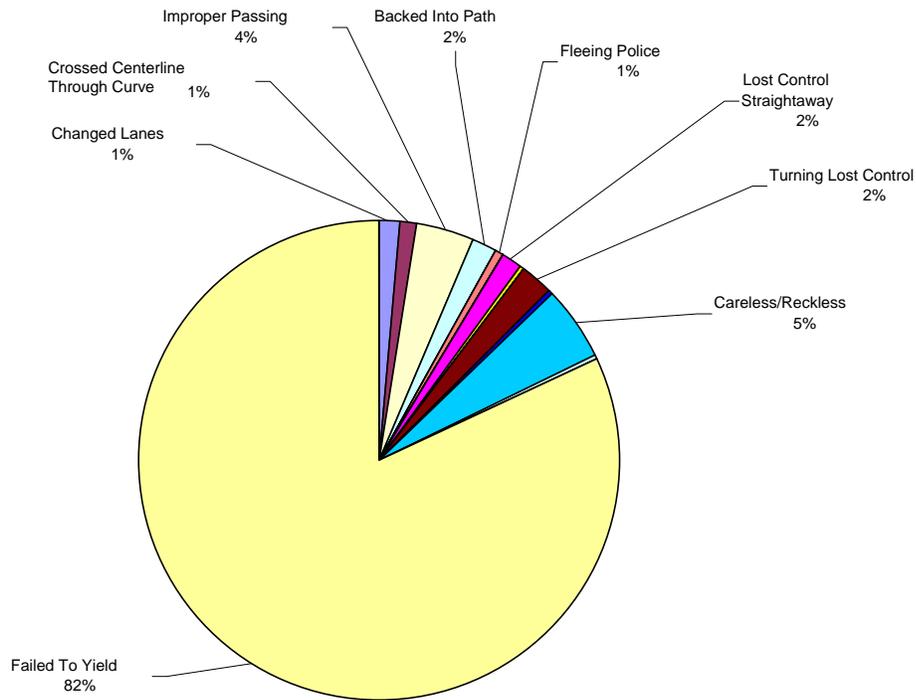

The Angle Crash

The leading type of M-V crash is the Angle crash, which accounts for 19.2% of all motorcycle crashes and 36.2% of the M-V motorcycle crashes.

The Angle crash is described in the State of Michigan UD-10 Traffic Crash Report Instruction Manual as a crash where the intended direction of travel prior to impact is basically perpendicular for both vehicles and the impact is approximately 90 degrees. Crashes are not considered Angle crashes if the impact takes place during a Head On – Left Turn, Rear End – Left Turn, or Rear End – Right Turn. Those crashes have their own classification. The most common Angle crash usually occurs at an intersection with another road, alley, or driveway. Even with the instructions provided, a small number of the Angle crashes reviewed occurred during U-Turn maneuvers or other maneuvers that would have been more appropriately classified elsewhere.

Chart 9 shows how the Angle crashes occurred. The chart is applicable to all motor vehicles involved not just the motorcycle.

Chart 9: Angle Crash Remarks

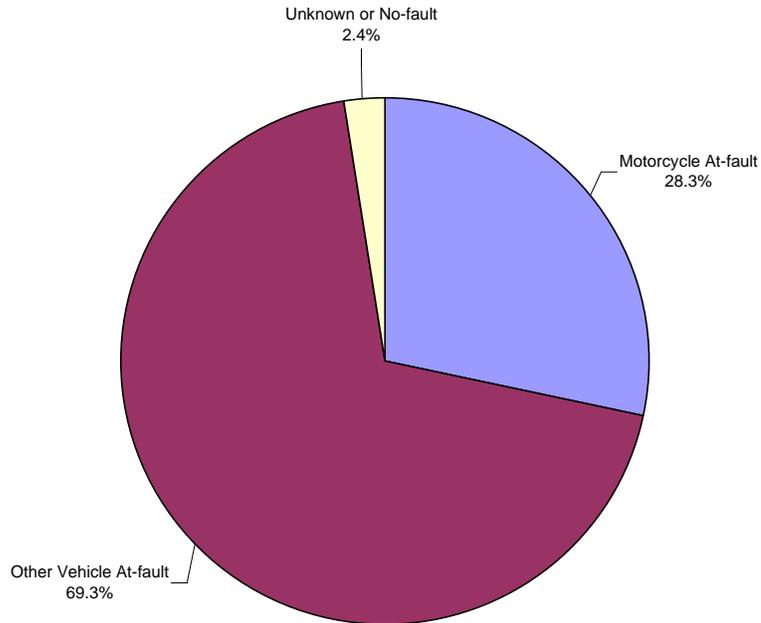

Because of the nature of the Angle crash it would be expected that failure to yield would be the most common action associated with this type of crash and the data confirms this to be true. Over 80% of all Angle crashes involve driver's failure to yield the right-of-way to another. Of the 480 cases of failure to yield, 395 were committed by the motor vehicle that struck the motorcycle.

A failure to yield in this particular analysis was determined by reviewing the Crash Diagram and Remarks section of the UD-10 and is not to be confused with the hazardous action, fail to yield. This condition is comprised of the following actions listed by frequency of occurrence:

- A motor vehicle entered into the path of another motor vehicle from another road, alley, or driveway
- An oncoming motor vehicle turned left in front of the other motor vehicle
- A motor vehicle disregarded a signal, stop sign, or yield sign and entered into the path of another motor vehicle

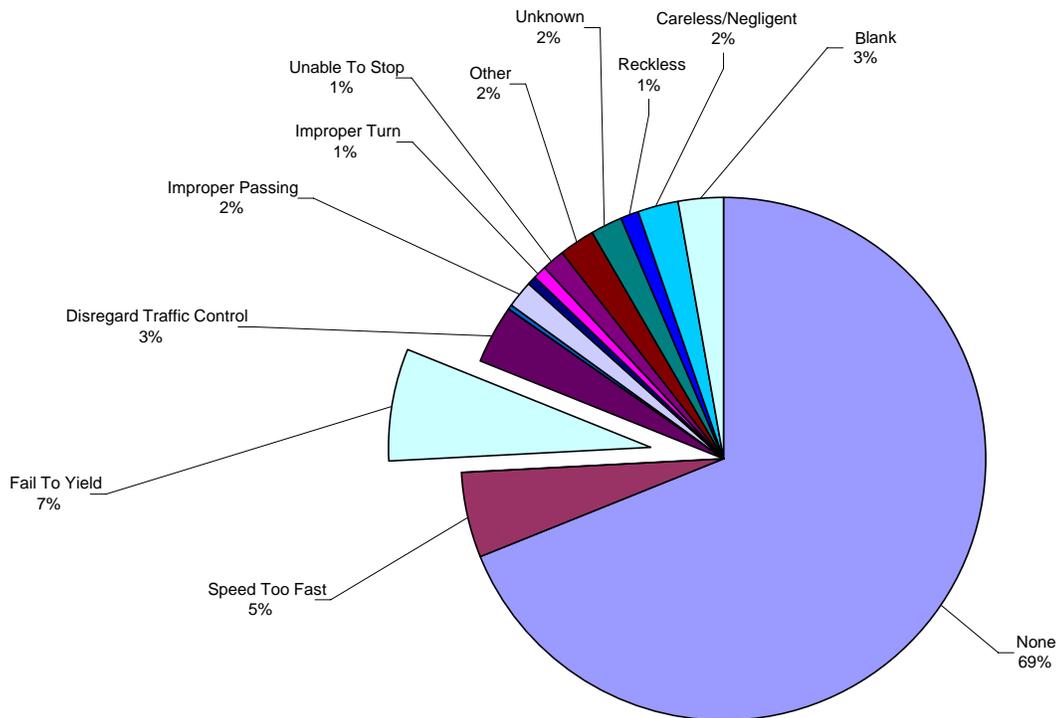

Chart 10 shows nearly 70% of all motorcycle Angle crashes are the fault of the motor vehicle that collided with the motorcycle.

Chart 10: Fault and the Angle Crash

In approximately 28% of all Angle crashes, the motorcyclist was found at-fault. Chart 11 reveals how those hazardous actions were assigned. Fail to yield has been separated from the other actions to show emphasis. The data shows that in 7% of Angle crashes, fail to yield was associated with the actions of the motorcycle.

Chart 11: Hazardous Action and the Motorcycle – Angle Crash

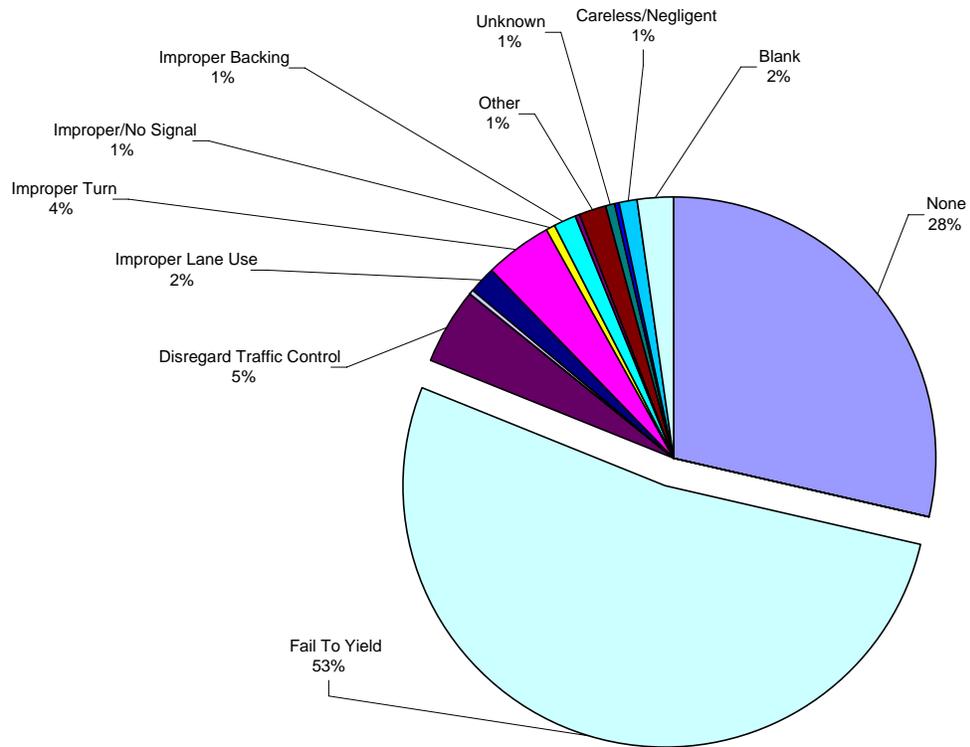

Where the motorcycle is found at-fault, the three most frequent hazardous actions noted are:

- Fail to yield
- Speed too fast
- Disregard a traffic control device

Approximately 70% of all Angle crashes are the fault of the motor vehicle that collided with the motorcycle. Chart 12 shows where the other motor vehicle was determined to be at-fault in terms of hazardous action. Again, fail to yield actions have been separated for emphasis. The data shows that 53% of all Angle crashes involve a failure to yield the right-of-way to the motorcycle.

Chart 12: Hazardous Action and the Other Vehicle – Angle Crash

In Angle crashes where the other motor vehicle is found at-fault, the three most common hazardous actions noted are:

- Fail to yield
- Disregard a traffic control device
- Improper turn

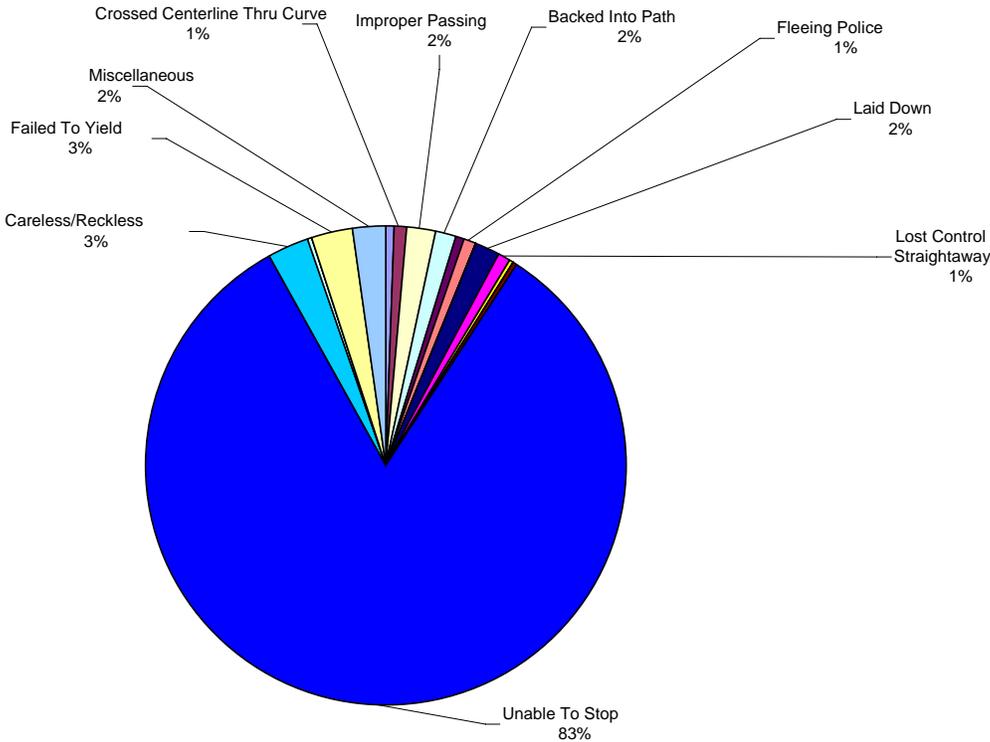

The Rear End Crash

The second most common M-V crash is the Rear End crash, accounting for 14.3% of all motorcycle crashes and 27.1% of the M-V motorcycle crashes.

The UD-10 Traffic Crash Report Instruction Manual defines a Rear End crash as a collision between motor vehicles traveling in the same direction, one behind the other, and no turn is involved.

Chart 13 shows how the Rear End crashes occurred.

Chart 13: Rear End Crash Remarks

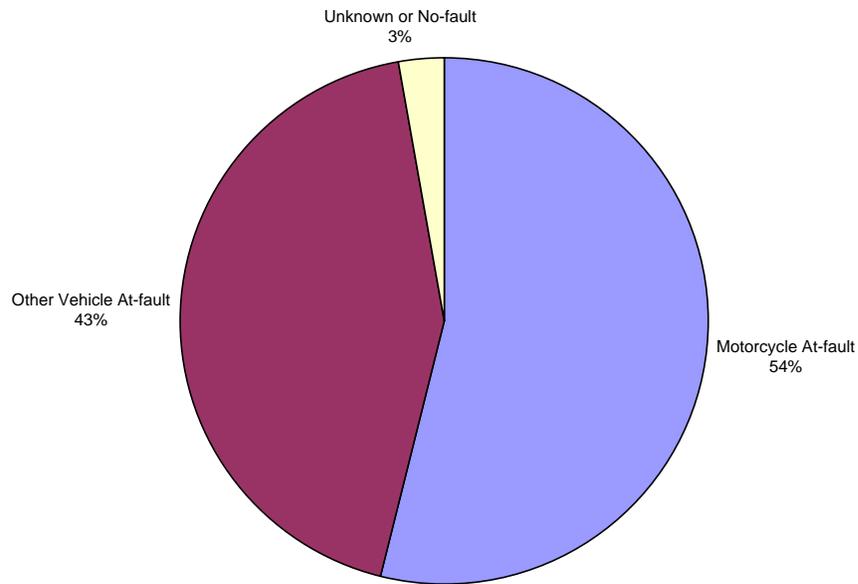

Again, the most common action associated with the Rear End crash is unable-to-stop and colliding with the rear of another vehicle. When the actions described in Chart 13 are broken down by which operator committed the action, certain differences begin to emerge.

- 78.4 % of the motorcycle operators were unable to stop and rear- ended the vehicle ahead
- 88.2% of the other vehicle operators were unable to stop and rear- ended the motorcycle ahead

Chart 14 shows that when fault is considered, further differences in Rear End motorcycle crashes as compared to Angle motorcycle crashes become apparent when fault is considered. Chart 14 illustrates this point.

Chart 14: Fault and the Rear End Crash

In the Angle crash, it was determined that nearly 80% of those types of crashes are the fault of the operator of the vehicle that collided with the motorcycle. In Rear End crashes, fault is almost equally split between involved parties with the motorcyclists slightly more often at-fault.

The most common hazardous action associated with the Rear End crash was, unable-to-stop.

- 38.1% of the motorcycle operators were associated with this fault
- 30.7% of the other motor vehicle operators were associated with this fault

What is noteworthy is that unlike the other motor vehicle operators, motorcycle operators involved in Rear End crashes had a higher incidence of excessive speed and reckless operation in conjunction with the crash.

- 8.0% involved excessive speed or reckless operation
- 0.2% of the other motor vehicles involved excessive speed or reckless operation

Charts 15 and 16 each display the hazardous actions on the part of the motorcycle and the other motor vehicle for the Rear End crash. Unable-to-stop has been separated for emphasis.

Chart 15: Hazardous Action and the Motorcycle – Rear End

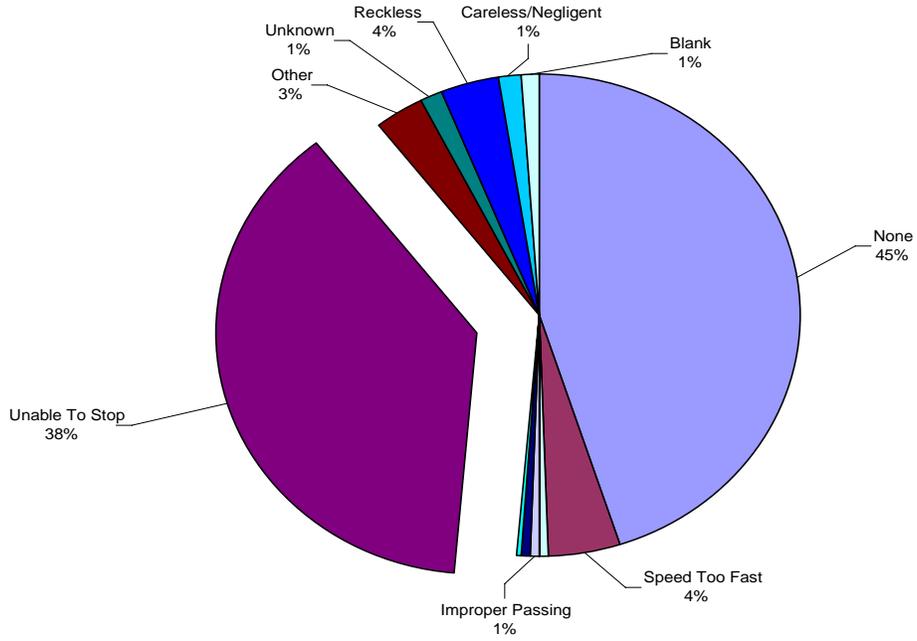

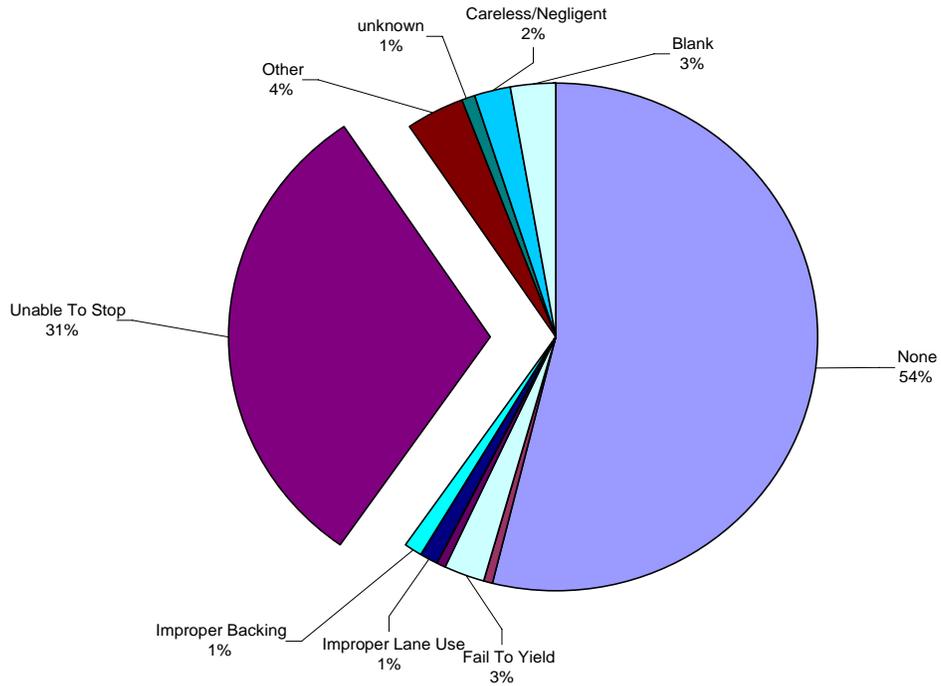

Chart 16: Hazardous Action and the Other Vehicle – Rear End

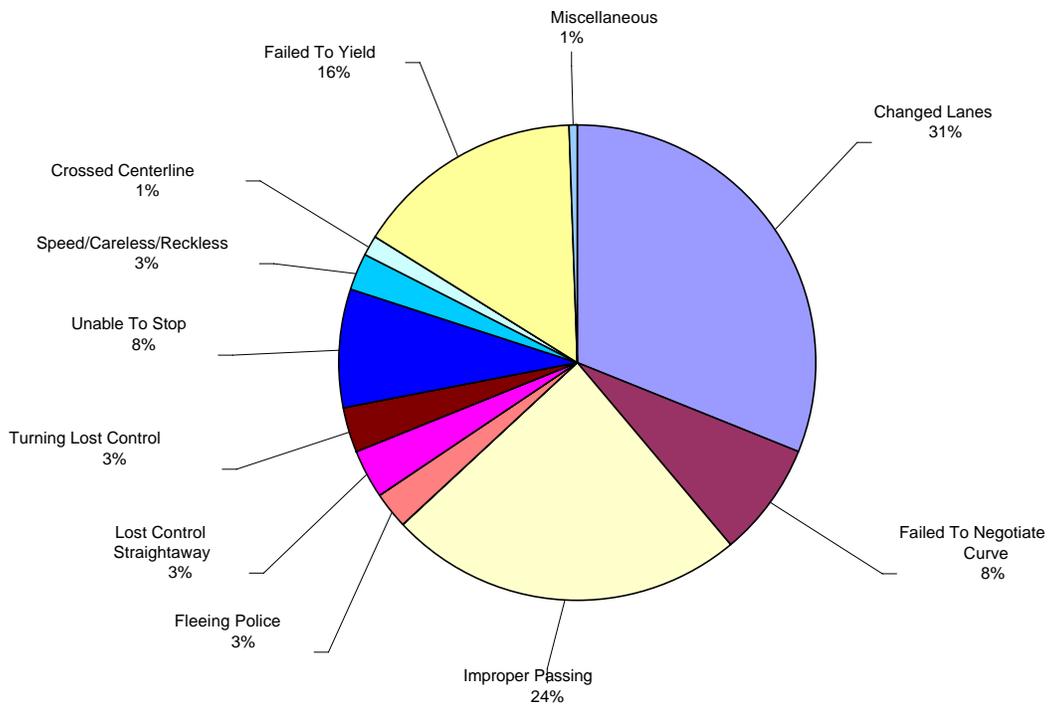

The Sideswipe Same Direction Crash

The third most common M-V crash is the Sideswipe Same Direction crash, accounting for 5.8% of all motorcycle crashes and 10.9% of the M-V motorcycle crashes.

The UD-10 Traffic Crash Report Instruction Manual defines the Sideswipe Same Direction crash as a collision between vehicles traveling in the same direction making side contact. Sideswipe crashes differ from Angle crashes in that a Sideswipe is a glancing impact and should not in itself stop the forward movement of the vehicle.

Chart 17 shows how the Sideswipe Same Direction crashes occurred.

Chart 17: Sideswipe Same Direction Crash Remarks

Again, because of the nature of the Sideswipe Same Direction crash, 50% of the crashes occur because of an improper lane change or an improper passing situation.

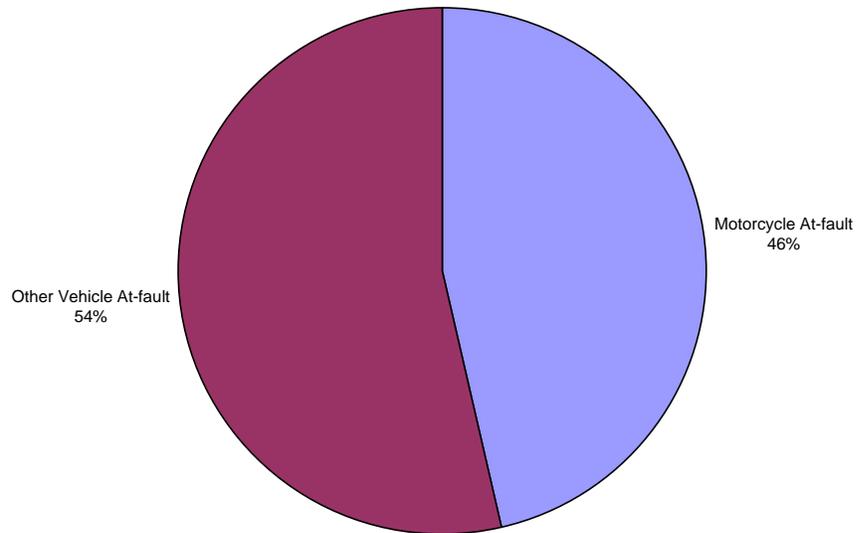

Improper lane driving as it pertains to Sideswipe Same Direction crashes include:

- Improper lane changes
- Loss of control on a curve and intruding into another lane
- Improperly passing another motor vehicle
- Following too close and sideswiping the lead motor vehicle in an attempt to avoid a rear end collision
- Failure to yield by driving into the path of another motor vehicle and causing a sideswipe impact

The analysis of fault and the Sideswipe Same Direction crash reveals similar results to the Rear End crash except that more than 50% are the fault of the other motor vehicle operator rather than the motorcycle operator.

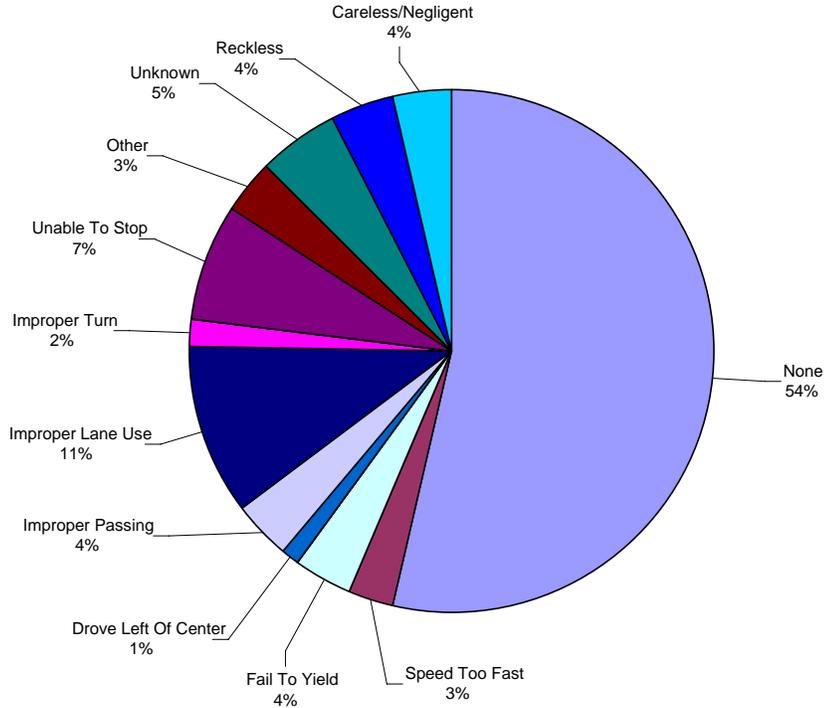

Chart 18 illustrates fault and the Sideswipe Same Direction crash.

Chart 18: Fault and the Sideswipe Same Direction Crash

Charts 19 and 20 display the hazardous actions on the part of the motorcycle and the other motor vehicle for the Sideswipe Same Direction crash.

Chart 19: Hazardous Action and the Motorcycle – Sideswipe Same

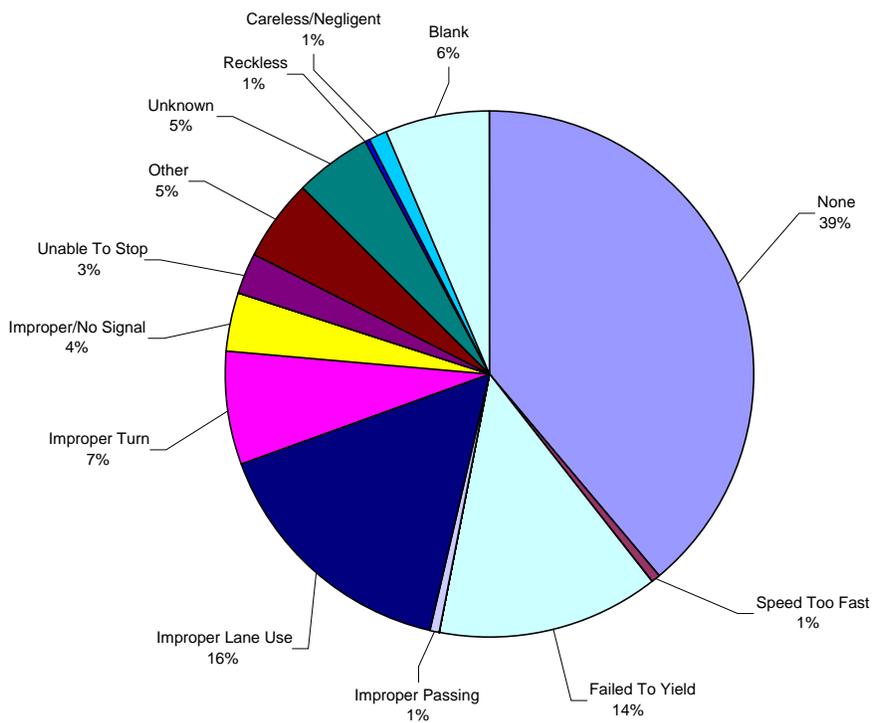

The top three hazardous actions attributed to 23.2% of the motorcycle operator are:

- Improper lane use
- Unable-to-stop
- Unknown

Excessive speed, careless operation, or reckless operation account for 10% of the hazardous actions.

Chart 20: Hazardous Action and the Other Vehicle – Sideswipe Same

The top three hazardous actions present in 36.3% of the other motor vehicle crashes are:

- Improper lane use
- Fail to yield
- Improper turn

For comparison purposes, 2.1% of the hazardous actions were for excessive speed, careless operation, or reckless operation.

The Remaining Multi-Vehicle Crash Types

The six remaining M-V crash types, when combined, account for 13.7% of all motorcycle crashes and 25.8% of the M-V motorcycle crashes. Listed in order of frequency of occurrence they are:

- Head On Left-Turn
- Other/Unknown
- Head On
- Sideswipe Opposite Direction
- Rear End Left-Turn
- Rear End Right-Turn

Brief descriptions of the six M-V crash types are:

Head On Left-Turn	Two vehicles approaching and at least one is attempting a left turn
Other/Unknown	The crash does not fit any other classification
Head On	The intended direction of travel of both vehicles is toward each other
Sideswipe Opposite impact	Vehicles traveling in opposite directions and make a glancing side impact
Rear End Left-Turn	A vehicle intending a left turn is struck from the rear
Rear End Right-Turn	A vehicle intending a right turn is struck from the rear

There are a plethora of actions associated with these six M-V crash types, but some stand out as more common than others.

The following three actions occur most frequently and account for 63.6% of those actions where motorcycle involvement is concerned:

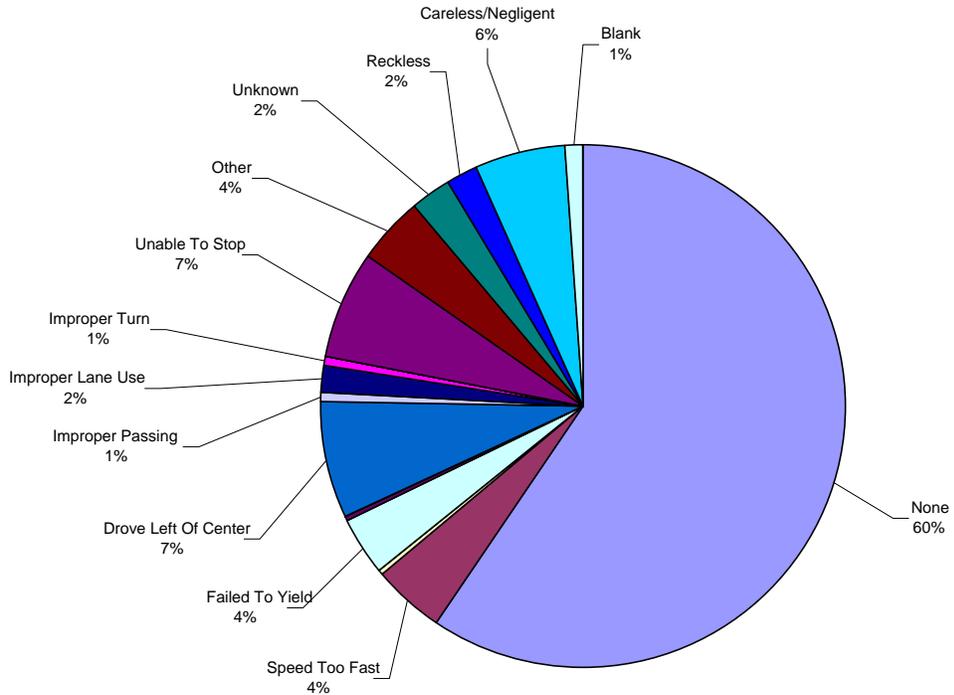

- Following too closely and unable to stop
- Failure to negotiate a curve or crossed the centerline through a curve
- Lost control on a straight road

The following three actions associated with the other motor vehicle occurred in 65.2% of the crashes:

- A left turn into the path of the oncoming motorcycle
- A failure to yield at an intersection or exiting an alley or driveway
- An improper lane change

Charts 21 and 22 display the hazardous actions on the part of the motorcycle and the other vehicle for the remaining six crash types.

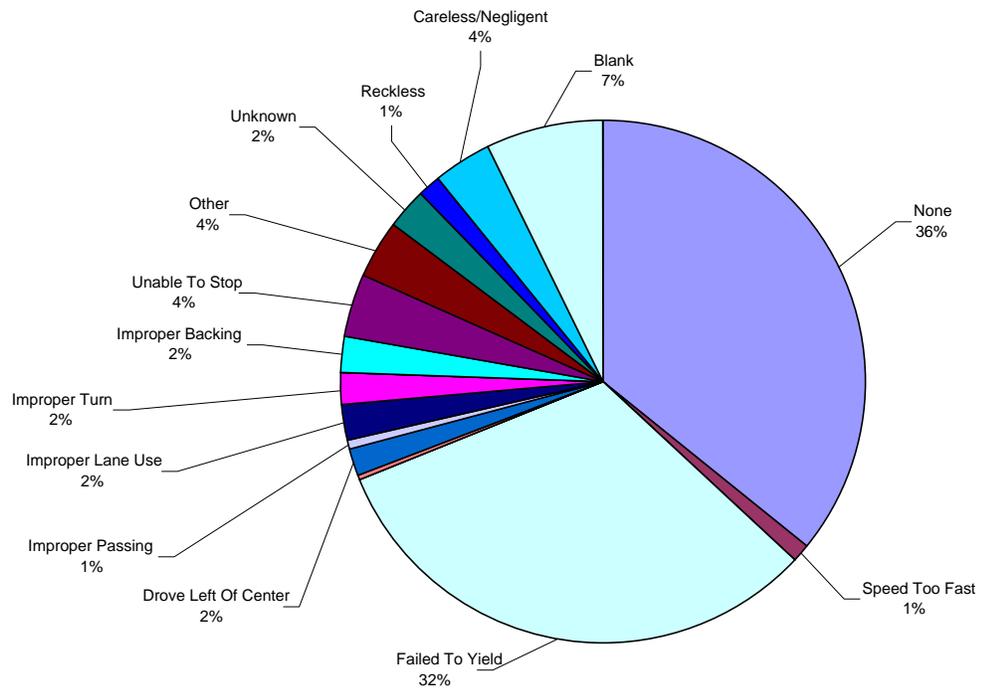

Chart 21: Hazardous Action and the Motorcycle – All Remaining Types

There were 176 instances where the motorcycle operator was credited with a hazardous action in association with these crashes. The top four actions common with 24% of the crashes are:

- 7% Drove left of center
- 7% Unable-to-stop
- 6% Careless/Negligent operation
- 4% Speed too fast

Chart 22: Hazardous Action and the Other Vehicle – All Remaining Types

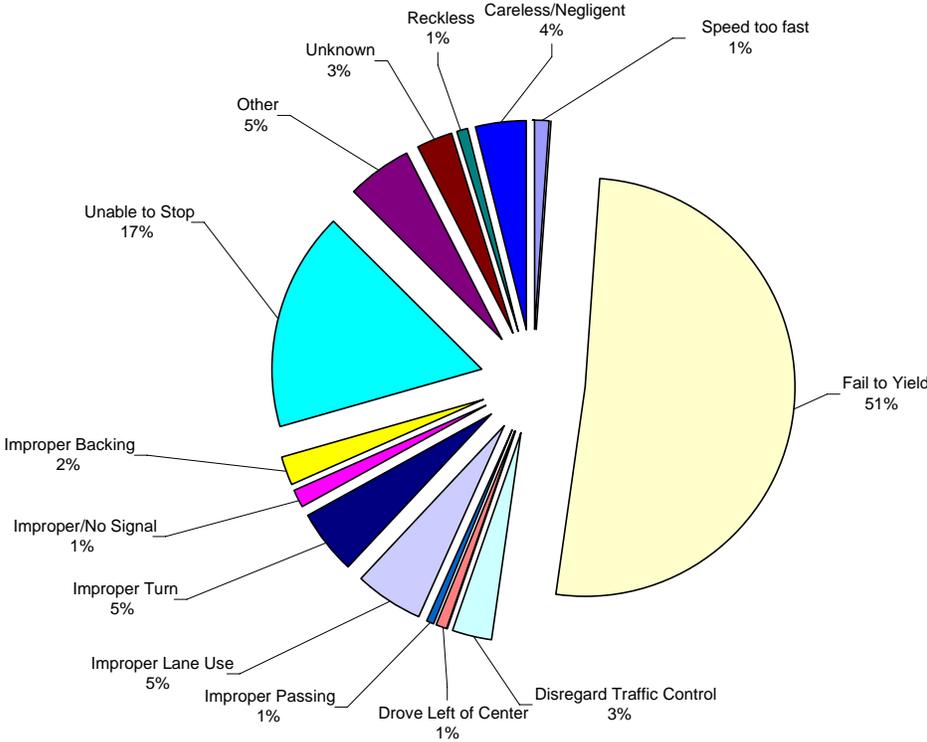

Several different, but applicable, hazardous actions can be associated with these types of crashes but out of the 256 hazardous actions attributed to operators of the motor vehicle that collided with the motorcycle, failure to yield was noted 32% of the time.

Fault And All Multi-Vehicle Crash Types

The nine Multi-Vehicle crash types have been analyzed separately and will now be looked at in their entirety as they relate to hazardous actions.

Chart 23 displays all hazardous actions identified as occurring with the nine Multi-Vehicle crash types and the percentage of occurrence where the driver of the other motor vehicle is determined to be at-fault.

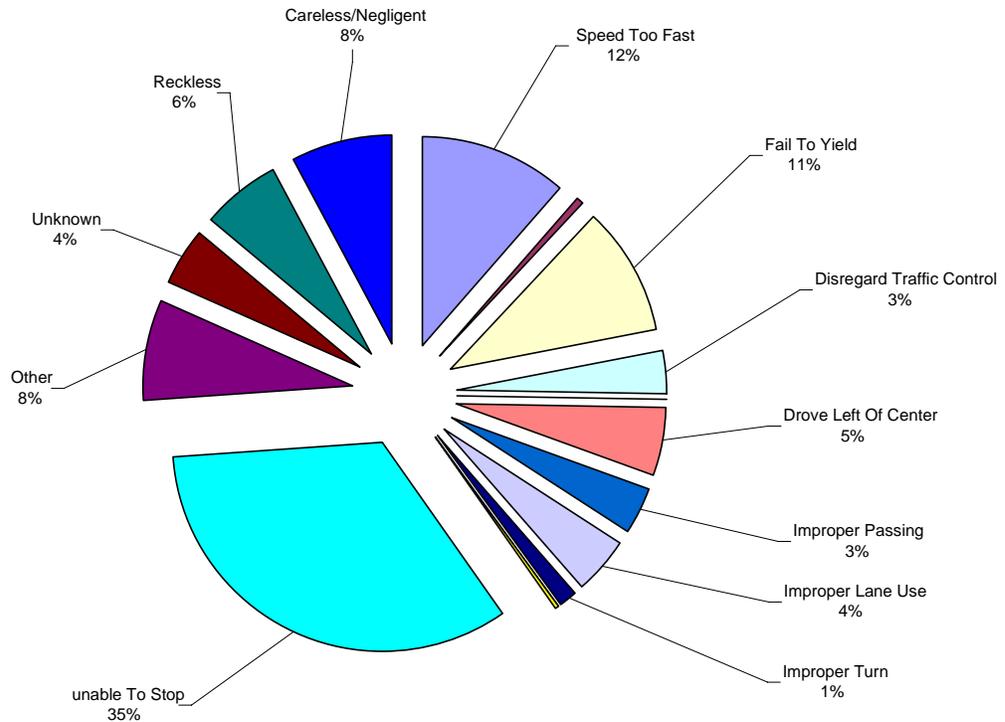

Chart 23: Multi-Vehicle Crash Fault – Other Vehicle At-Fault

In the crashes where the vehicle was found at fault, failure to yield was the predominant hazardous action occurring 51% of the time.

Chart 24 displays the same hazardous action information for the motorcycle.

Chart 24: Multi-Vehicle Crash Fault – Motorcycle At-Fault

When combined, excessive speed, careless/negligent operation, and reckless operation account for 26% of the actions associated with fault on the part of the motorcyclist. Following too close or unable to stop in time to avoid a collision account for 35% of the at-fault crashes. Following too close and unable to stop are nearly always associated with driving too fast for conditions. When combining the four mentioned hazardous actions, the data shows that they are present in 61% of the crashes where the motorcyclist is found at-fault.

Several factors associated with all motorcycle crashes in Michigan have now been analyzed to the extent allowed by the available data. Before any further conclusions can be ascertained, a comparison of those factors to those same factors as they relate to all motor vehicle crashes must be completed in an effort to identify those factors unique to motorcycle crashes.

Fault by Comparison

The "2004 Michigan Traffic Crash Facts" publication contains data on driver hazardous action in relation to all reported traffic crashes. This analysis of Michigan's motorcycle crashes contains data specific to motorcycle crashes. Table 7 shows a comparison between the two sets of data.

Table 7: Hazardous Action Comparison

Hazardous Action	All Crashes % of Total	Motorcycle Crashes % of Total
None	48.2%	45.5%
Speed Too Fast	5.9%	8.5%
Speed Too Slow	0.3%	0.2%
Failed To Yield	8.7%	11.7%
Disregard Traffic Control	2.2%	1.2%
Drove Wrong Way	0.1%	0.1%
Drove Left Of Center	0.6%	1.1%
Improper Passing	0.6%	0.7%
Improper Lane Use	2.1%	1.8%
Improper Turn	1.0%	1.3%
Improper/No Signal	0.1%	0.3%
Improper Backing	1.7%	0.5%
Unable To Stop	13.2%	9.1%
Reckless Driving	0.5%	1.8%
Careless/Negligent	2.2%	4.4%
Other	3.5%	6.1%
Unknown	9.2%	3.4%

Specific operators in relation to all crashes will also be compared. Table 8 compares all crashes in Michigan to the study population of motorcycle operators and operators of the motor vehicle that collided with them.

Table 8: Operator Comparison

Hazardous Action	All Crashes %	Motorcycle %	Other Vehicle %
None	48.2%	49.3%	38.4%
Speed Too Fast	5.9%	12.7%	0.6%
Speed Too Slow	0.3%	0.2%	0.0%
Failed To Yield	8.7%	2.3%	29.4%
Disregard Traffic Control	2.2%	0.9%	1.8%
Drove Wrong Way	0.1%	0.1%	0.1%
Drove Left Of Center	0.6%	1.4%	0.5%
Improper Passing	0.6%	0.9%	0.3%
Improper Lane Use	2.1%	1.2%	3.0%
Improper Turn	1.0%	0.4%	2.9%
Improper/No Signal	0.1%	0.0%	0.7%
Improper Backing	1.7%	0.0%	1.3%
Unable To Stop	13.2%	8.8%	9.8%
Reckless Driving	0.5%	2.5%	0.5%
Careless/Negligent	2.2%	5.6%	2.2%
Other	3.5%	7.7%	2.9%
Unknown	9.2%	4.3%	1.6%

With respect to the operator of the motorcycle involved in a crash, the most common aspects are:

- Failure to negotiate a curve or a loss of control on a straight road due to excessive speed
- A loss of control or inability to avoid a collision due to excessive speed, reckless operation, or careless/negligent operation

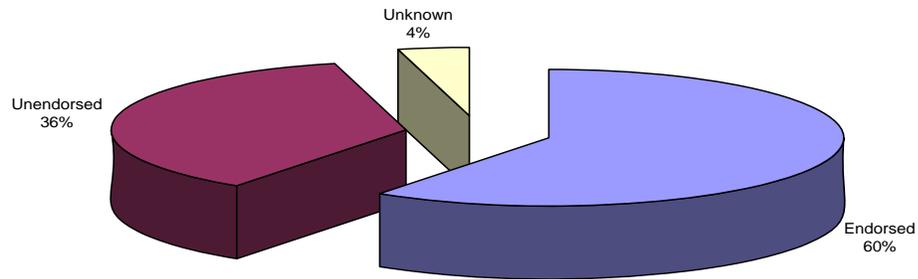

With respect to the operator of a motor vehicle that collides with a motorcycle, the single most common aspect is:

- A failure to yield the right-of-way to the motorcycle by:
 - Making a left turn into the path of the motorcycle
 - Driving into the path of the motorcycle at an intersection or leaving a driveway or alley

The Unendorsed Operator

There was some difference in the number of unendorsed vs. endorsed motorcyclists between this study and the study of serious motorcycle crashes. In the serious motorcycle crash study, it was determined that an average of 41.5% of all motorcycle operators were unendorsed and this study reveals that 36.3% met those criteria. Chart 25 depicts the respective percentages based on endorsement.

Chart 25: Endorsed

When studying the number of endorsed vs. unendorsed operators based on crash type, there was no noticeable difference observed.

The percentage of unendorsed vs. endorsed operators was studied in relationship to fault. Chart 26 shows that 52.6% of those found at-fault in a crash were properly endorsed, while 41.3% were unendorsed. It might be concluded from this data that a properly licensed operator is more likely to be found at-fault than not, but it is believed a logical and correct interpretation requires further analysis, which is represented in Chart 27.

Chart 26: At-Fault and Endorsed

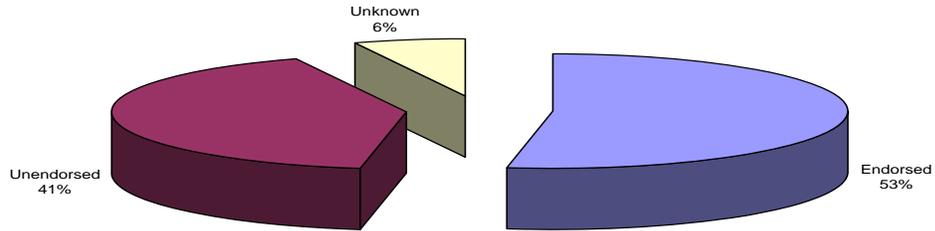

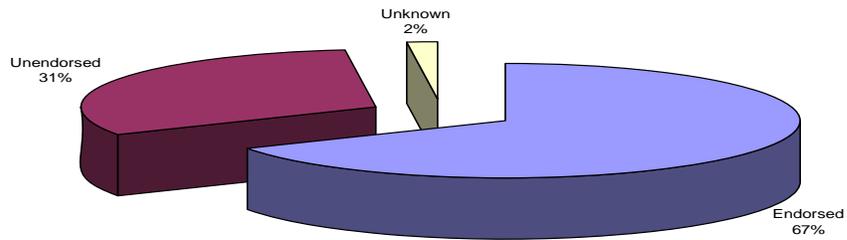

Chart 27 shows that 66.9% of the operators found not at-fault in a crash were properly endorsed, while 31.3% were unendorsed.

Chart 27: Not At-Fault and Endorsed

The data concludes that a properly endorsed motorcycle operator involved in a crash is less likely to be found at-fault for the crash. The margin is slim but nonetheless present.

There is no published data available to make the comparison between unendorsed motorcycle operators and unlicensed drivers involved in all traffic crashes as a whole. Such a comparison would effect the conclusions on proper licensing and any likelihood of involvement in a crash.

Relating Age to Endorsement

How various age groups relate to one another in holding a valid operator license is also relevant for the analysis. The average age for a motorcycle operator involved in a crash is 40 and there is a one in three chance that the operator is unendorsed. Table 9 shows the various age groups and their percentage of the overall group and the percentage of unendorsed operators within each group.

Table 9: Age and Endorsement

Age Group	Numbers	% of Operators	% Unendorsed
16 – 24	523	15.9%	51.8%
25 – 34	699	21.3%	41.5%
35 – 44	743	22.6%	33.6%
45 – 54	833	25.4%	31.6%
55 – 64	355	10.8%	29.0%
65 – over	67	2.0%	17.9%
Unknowns	64	1.9%	n/a

Initially the data shows that the smallest group by numbers is the age group 65 and over. This group also has the best ratio of operators with a valid license.

The age group with the largest percentage of unendorsed operators is 16 through 24. Over half of the operators in this group did not have a valid endorsement. This group falls fourth out of six in terms of size.

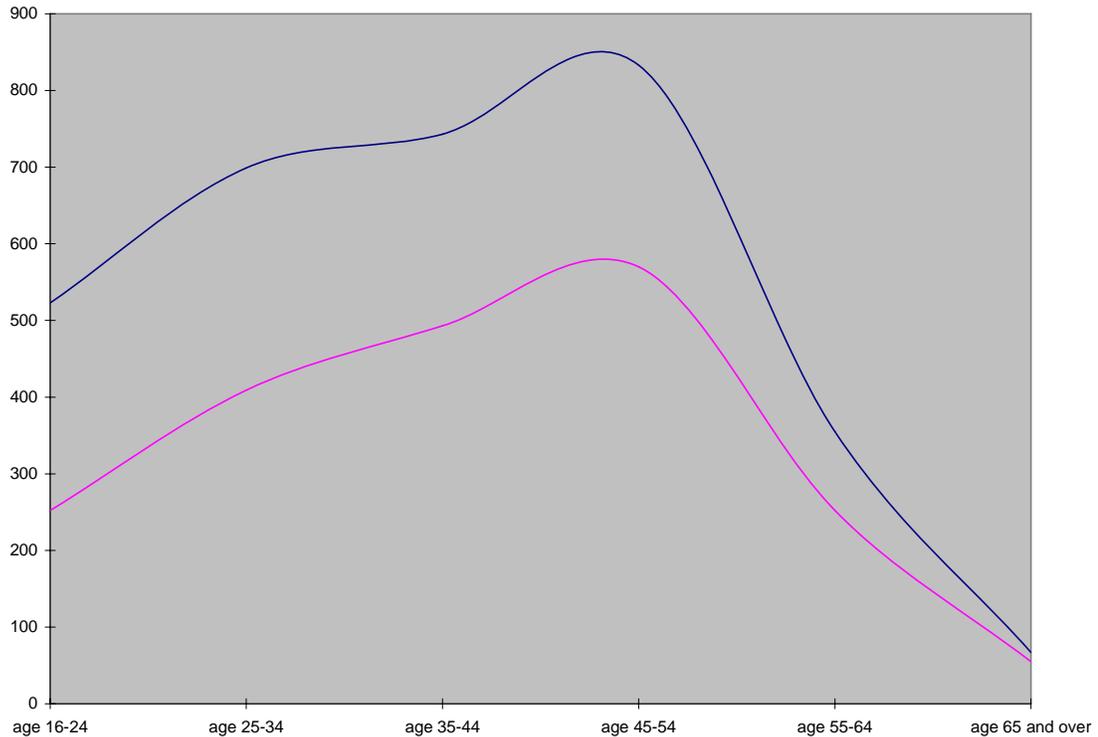

Under Michigan law, a person must be at least age 16 to apply for a motorcycle endorsement. Those persons age 16 and 17 must successfully complete an approved motorcycle safety course before they are eligible to obtain that endorsement. There were 12 crashes involving a motorcycle operator 17 years of age in 2004. Four of those held a motorcycle endorsement, four did not, and the license status of the remaining four was unknown. There were five crashes involving a motorcycle operator 16 years of age in 2004. One held a motorcycle endorsement, one did not, and the license status of the remaining three was unknown. Factoring out the unknowns, this data shows that 16 and 17 year olds fall within their age group in that only half of them held an endorsement.

The group age 25 through 34 have the largest percentage of endorsed operators and also ranks third in terms of size.

The group age 45 through 54 ranks first in terms of size and while it has the largest number of endorsed operators, it ranks third in percentage of unendorsed operators.

Chart 28 depicts another way to visualize this data. The upper curve represents the total number of motorcycle operators, while the lower curve represents the numbers of operators with an endorsement. This graph shows it is only after approximately age 50 that the number of operators with an endorsement approaches 100% of the respective age population.

Chart 28: Age and Endorsement

It is also relevant to analyze age and crash involvement. Table 10 displays the percentage of operators within a specific age group and numbers of operators involved in a crash.

Table 10: Age and Crash Involvement

Age Group	# of Endorsed	% of Endorsed	# In Crash	% of Crash Total
16 & 17	493	1.0%	17	3.4%
16 – 24	13,626	2.8%	548	17.8%
25 – 64	441,155	90.3%	2,599	84.2%
65 +	33,281	6.8%	64	2.1%

This data reveals that motorcycle operators age 16 and 17 make up 1% of the total population of endorsed operators but are involved in 3.4% of the crashes. Also, the group age 16 through 24, which accounts for 2.8% of endorsed operators, is involved in 17.8% of the crashes. Contrast this with the group age 65 and older, which makes up 6.8% of the endorsed operators but are involved in only 2.1% of the crashes. Finally, the group age 25 through 64, which accounts for 90.3% of all endorsed operators, is involved in only 84.2% of the crashes.

Crash Severity and Fault

Michigan's motorcycle crashes can also be broken down based on injury and severity.

During 2004, there were a total of 3,291 motorcycle crashes analyzed. The analysis shows 751 (22.8%) were property damage only, 1,874 (56.9%) were minor injury crashes, and 666 (20.2%) were serious injury or fatal crashes.

As a general rule, the more severe the crash, the more fault was placed on the motorcycle operator. Further examination of this data provides a more detailed explanation.

Six crash types indicate that as crash severity increased so did the number of at-fault motorcyclists.

- Single Motor Vehicle
- Rear End
- Sideswipe Same Direction
- Other/Unknown
- Rear End – Left Turn
- Rear End – Right Turn

Three crash types indicate that as crash severity increased, the number of at-fault motorcyclists decreased.

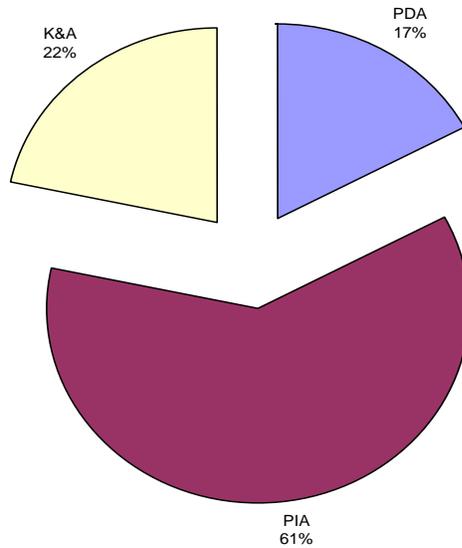

- Angle
- Head On – Left turn
- Sideswipe Opposite Direction

One crash type remained steady when comparing severity to fault.

- Head On

There appears to be a correlation between crash type, severity, and fault. To better understand this correlation, each crash type must be further analyzed. Charts 29 through 34 provide further analysis of the six crash types that indicate an increase in fault on the part of the motorcyclist.

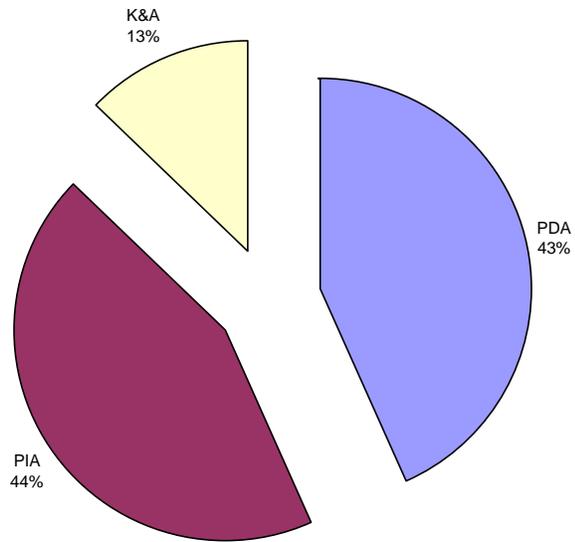

Chart 29: Single Motor Vehicle

As the severity of the Single Motor Vehicle crash increases so does the percentage of motorcyclists found at fault.

- Property damage crashes account for 17.2% of SMV crashes.
 - 43.6% of motorcyclist found at-fault
- Minor injury crashes account for 61.1% of SMV crashes.
 - 58.1% of motorcyclist found at-fault
- Serious injury/fatal crashes account for 21.7% of SMV crashes.
 - 75.8% of motorcyclist found at-fault

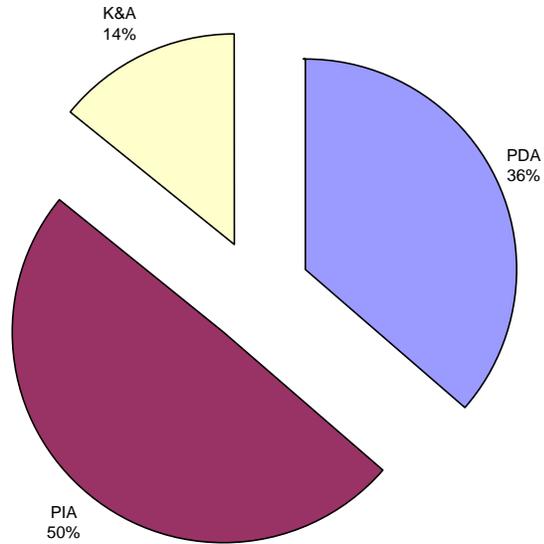

Chart 30: Rear End

As the severity of the Rear End crash increases so does the percentage of motorcyclists found at fault.

- Property damage crashes account for 43.2% of Rear End crashes.
 - 44.6% of motorcyclist found at-fault
- Minor injury crashes account for 44.1% of Rear End crashes.
 - 60.1% of motorcyclist found at-fault
- Serious injury/fatal crashes account for 12.7% of Rear End crashes.
 - 65.0% of motorcyclist found at-fault

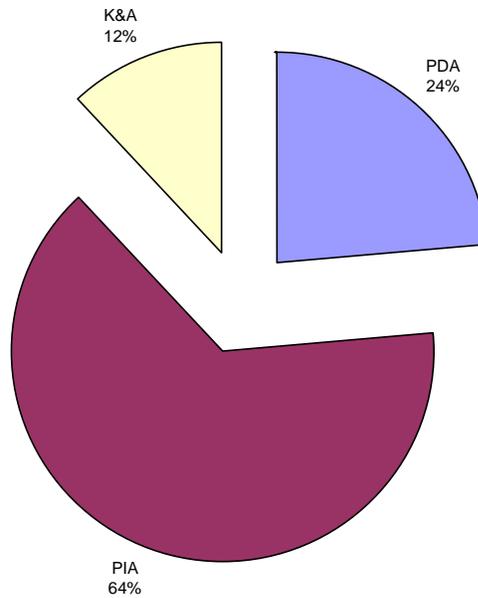

Chart 31: Sideswipe Same Direction

As the severity of the Sideswipe Same Direction crash increases so does the percentage of motorcyclists found at fault.

- Property damage crashes account for 36.3% of Sideswipe Same Direction crashes.
 - 52.2% of motorcyclist found at-fault
- Minor injury crashes account for 49.5% of Sideswipe Same Direction crashes.
 - 37.2% of motorcyclist found at-fault
- Serious injury/fatal crashes account for 14.2% of Sideswipe Same Direction crashes.
 - 63.0% of motorcyclist found at-fault

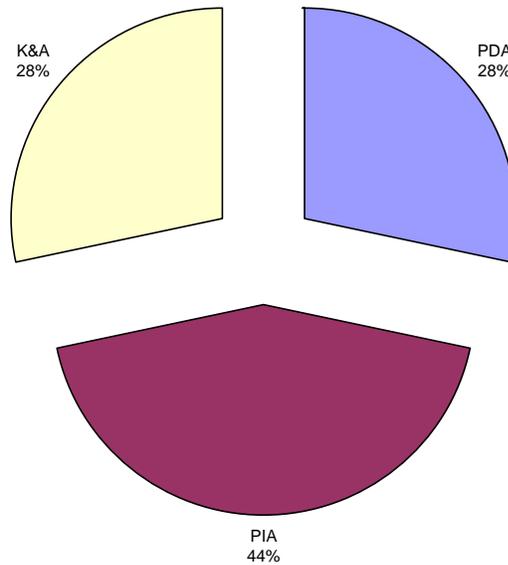

Chart 32: Other/Unknown

As the severity of the Other/Unknown crash increases so does the percentage of motorcyclists found at fault.

- Property damage crashes account for 23.6% of Other/Unknown crashes.
 - 23.3% of motorcyclist found at-fault
- Minor injury crashes account for 64.6% of Other/Unknown crashes.
 - 34.1% of motorcyclist found at-fault
- Serious injury/fatal crashes account for 11.8% of Other/Unknown crashes.
 - 40.0% of motorcyclist found at-fault

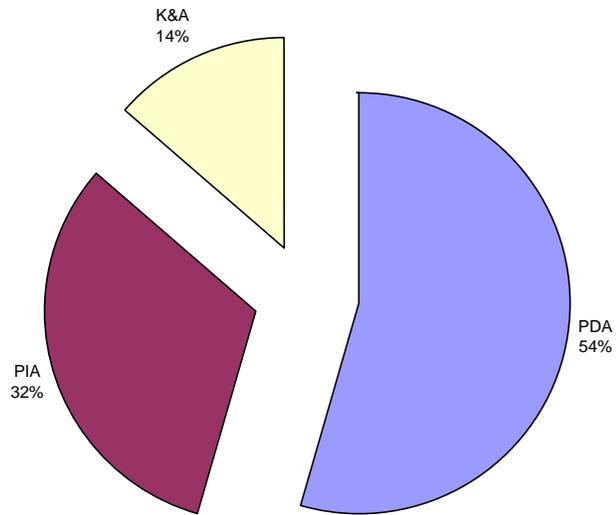

Chart 33: Rear End – Left Turn

As the severity of the Rear End – Left Turn crash increases so does the percentage of motorcyclists found at fault.

- Property damage crashes account for 28.3% of Rear End – Left Turn crashes.
 - 53.8% of motorcyclist found at-fault
- Minor injury crashes account for 43.4% of Rear End – Left Turn crashes.
 - 70.0% of motorcyclist found at-fault
- Serious injury/fatal crashes account for 28.3% of Rear End – Left Turn crashes.
 - 76.9% of motorcyclist found at-fault

Chart 34: Rear End – Right Turn

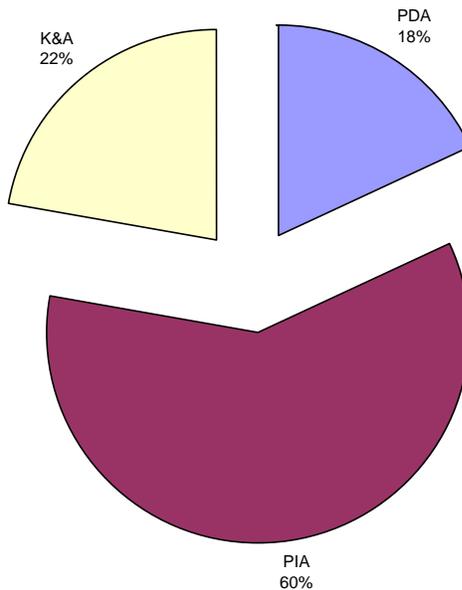

As the severity of the Rear End – Right Turn crash increases so does the percentage of motorcyclists found at fault.

- Property damage crashes account for 54.5% of Rear End – Right Turn crashes.
 - 25.0% of motorcyclist found at-fault
- Minor injury crashes account for 31.8% of Rear End – Right Turn crashes.
 - 71.4% of motorcyclist found at-fault
- Serious injury/fatal crashes account for 13.6% of Rear End – Right Turn crashes.
 - 66.7% of motorcyclist found at-fault

Charts 35 through 37 provide further analysis of the three crash types that indicate a decreasing level of fault attributed to the motorcyclist as crash severity increased.

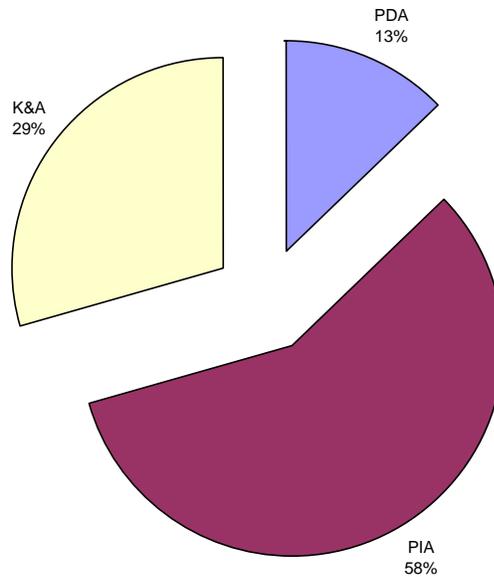

Chart 35: Angle

As the severity of the Angle crash increases, the percentage of motorcyclists found at fault decreases.

- Property damage crashes account for 18.0% of Angle crashes.
 - 41.2% of motorcyclist found at-fault
- Minor injury crashes account for 59.7% of Angle crashes.
 - 25.7% of motorcyclist found at-fault
- Serious injury/fatal crashes account for 22.3% of Angle crashes.
 - 24.8% of motorcyclist found at-fault

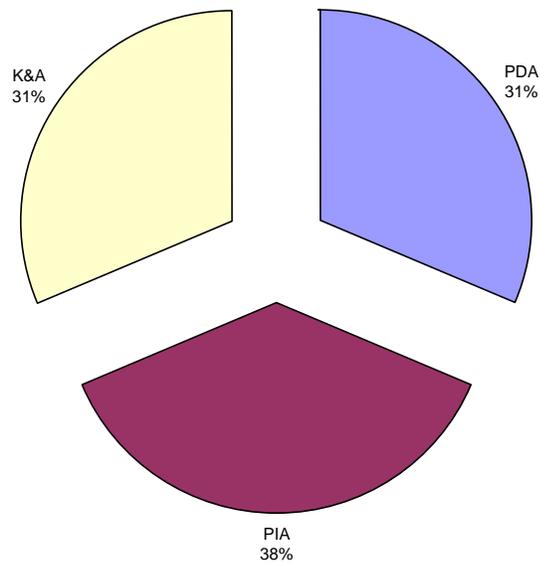

Chart 36: Head On – Left Turn

As the severity of the Head On – Left Turn crash increases, the percentage of motorcyclists found at fault decreases.

- Property damage crashes account for 12.8% of Head On – Left Turn crashes.
 - 29.4% of motorcyclist found at-fault
- Minor injury crashes account for 57.9% of Head On – Left Turn crashes.
 - 15.6% of motorcyclist found at-fault
- Serious injury/fatal crashes account for 29.3% of Head On – Left Turn crashes.
 - 10.3% of motorcyclist found at-fault

Chart 37: Sideswipe Opposite Direction

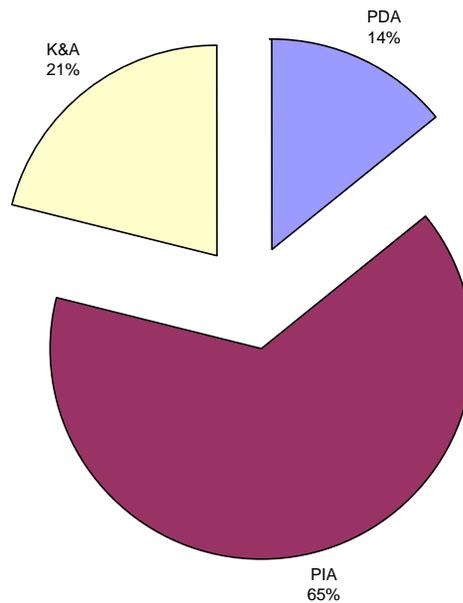

As the severity of the Sideswipe Opposite Direction crash increases, the percentage of motorcyclists found at fault decreases.

- Property damage crashes account for 31.4% of Sideswipe Opposite Direction crashes.
 - 87.5% of motorcyclist found at-fault
- Minor injury crashes account for 37.3% of Sideswipe Opposite Direction crashes.
 - 63.2% of motorcyclist found at-fault
- Serious injury/fatal crashes account for 31.4% of Sideswipe Opposite Direction crashes.
 - 56.3% of motorcyclist found at-fault

Chart 38 provides further analysis of the crash type that indicate no change in degree of fault as crash severity increased.

Chart 38: Head On

As the severity of the Head On crash increases the percentage of motorcyclists found at fault remains unchanged.

- Property damage crashes account for 14.1% of Head On crashes.
 - 60.0% of motorcyclist found at-fault
- Minor injury crashes account for 64.8% of Head On crashes.
 - 50.0% of motorcyclist found at-fault
- Serious injury/fatal crashes account for 21.1% of Head On crashes.
 - 60.0% of motorcyclist found at-fault

Impairment and Other Factors

As there is a lot of literature available on operator impairment, this analysis did not delve into operator impairment to the extent that other factors associated with motorcycle crashes were addressed. However, impairment with respect to the motorcycle operator involved in a crash was analyzed.

Alcohol and/or drugs are indicated for the motorcycle operator in 246 (7.5%) of the crashes during 2004.

The state of Michigan reports the number of traffic-related fatalities in terms of all fatalities related to a crash, including drivers, passengers, and pedestrians. There were 1,159 traffic-related fatalities in 2004, which included 79 related to motorcycle crashes. Of the overall reported fatalities, 497 were identified as a driver of a motor vehicle. The analysis defined 68 fatalities that were actually operating a motorcycle.

There were a reported 635,913 drivers involved in ALL traffic crashes in Michigan during 2004. The analysis indicates that 3,291 (5.2%) were operating a motorcycle. Published data also reveals that 15,072 of drivers involved in a traffic crash indicate some level of alcohol and/or drug use.

- Alcohol and/or drug use are indicated in 38.2% of motorcycle operator fatalities.
- Alcohol and/or drug use are indicated in 39.8% of ALL driver fatalities.
- Alcohol and/or drug use are indicated with 7.5% of motorcycle operators involved in a motorcycle crash.
- Alcohol and/or drug use are indicated with 2.4% of drivers involved in ALL crashes.

On the issue of obstructions to vision or instances where the operator of either vehicle "didn't see" the other vehicle, the analysis shows the following:

- One or the other operator stated that they "didn't see" the other vehicle prior to the crash in 9.3% of the crashes. The vast majority of those statements were made by the operator of the vehicle that collided with the motorcycle. The analysis also included instances where the clear view of traffic was obstructed by vegetation, buildings, or other vehicles.

Summary

Several factors significant to motorcycle crashes throughout this analysis have been identified. The following is a summary of the findings.

The number of motor vehicle registrations increased 107% since 1966, while the number of motorcycle registrations increased 157% over the same period. Motorcycles account for 2.4% of all registered motor vehicles in Michigan.

The annual number of ALL traffic crashes increased 23% since 1966, while the annual number of motorcycle crashes increased 20% over the same period. Motorcycle crashes account for 0.9% of ALL motor vehicle traffic crashes.

The annual number of traffic crash-related fatalities fell by 50% since 1966, while the annual number of motorcycle traffic-related fatalities fell by 24% over the same period. Motorcycle-related traffic fatalities account for 6.8% of ALL traffic crash related fatalities.

The annual death rate for ALL traffic crashes fell 78% since 1966, while the death rate for motorcyclists fell 70% during the same period. The death rate for a motorcyclist is 12.6 compared to 1.1 for all drivers.

Motorcyclists found at-fault in motorcycle crashes is 49.4%.

- 59% were found to be at-fault in a SMV motorcycle crash. One out of every three at-fault is because of excessive speed, careless/negligent operation, or reckless operation.
- 40.5% were found at-fault in Multi-Vehicle motorcycle crashes. One out of every five is for excessive speed, careless/negligent operation, or reckless operation.

“Other” vehicle operators found at-fault in Multi-Vehicle Motorcycle crashes is 57.6%.

- 29.4% were found at-fault because of failure to yield.

Single Motor Vehicle crashes are OVERREPRESENTED in motorcycle crashes. Single Motor Vehicle crashes average 30.8% of ALL traffic crashes annually since 1966, specifically 34.4% in 2004. Motorcycle Single Motor Vehicle crashes accounted for 47.0% of all motorcycle crashes in 2004.

The leading action associated with the motorcycle SMV crash (one out of every four) is a failure to negotiate a curve. The second most frequent action (16.5%) is a collision with an animal. The third most frequent action (10.5%) is a loss of control on a straight road.

Angle crashes are OVERREPRESENTED in motorcycle crashes. Angle crashes average 13.8% of ALL traffic crashes annually since 1966, specifically 18.9% in 2004. Motorcycle Angle crashes accounted for 19.2% of all motorcycle crashes in 2004.

Failure to yield is OVERREPRESENTED in motorcycle crashes. Failure to yield is attributed to 8.7% of driver hazardous actions in ALL traffic crashes but is present in 11.7% of driver hazardous actions in motorcycle-related traffic crashes.

- Over 80% of the Angle crashes involve an intrusion of one vehicle into the path of another vehicle from an intersecting road, alley, or driveway; an oncoming vehicle turning left into the path of the vehicle; or a vehicle disregarding a traffic control device at an intersection and colliding with the other vehicle.

- Failure to yield as a hazardous action is OVERREPRESENTED (52%) where the vehicle that collided with the motorcycle is concerned.
- Failure to yield as a hazardous action is UNDERREPRESENTED (7%) where the motorcycle that collided with the vehicle is concerned.

Although motorcycle crashes occur throughout the year, the vast majority (94.2%) occur from April 1 through October 31 and more than three quarters occur on dry roads during daylight hours.

Intersection crashes are UNDERREPRESENTED when compared to all traffic crashes. Slightly more than one-quarter (27.3%) occur within 150 feet of an intersection with another roadway, alley, or driveway as compared to 45.5% for all traffic crashes.

The average age for the motorcyclists involved in a crash is 40.

Motorcyclists' ages 16 and 17 comprise 1% of all endorsed operators but are involved in 3.4% of all motorcycle crashes. Motorcyclists in this age group are OVERREPRESENTED in terms of crash involvement.

Motorcyclists' age 16 through 24 comprise 2.8% of all endorsed operators but are involved in 17.8% of all motorcycle crashes. Motorcyclists in this age group are OVERREPRESENTED in terms of crash involvement.

Motorcyclists' age 25 through 64 comprise 90.3% of all endorsed operators but are involved in only 88.2% of all motorcycle crashes. Motorcyclists in this age group are UNDERREPRESENTED in terms of crash involvement.

Motorcyclists' age 65 and over comprise 6.8% of all endorsed operators but are involved in only 2.1% of all motorcycle crashes. Motorcyclists in this age group are UNDERREPRESENTED in terms of crash involvement.

Of all motorcyclists involved in a crash, 36.3% were unendorsed.

- 51.8% age 16-24 were unendorsed
- 33.3% age 25-64 were unendorsed
- 17.9% age 65 and older were unendorsed

The operator of a motorcycle involved in a crash has a 77.1% probability of being injured and a 20.2% chance of being seriously injured or killed.

In overall terms, as crash severity increases so does the percentage of motorcycle operators found at fault.

An increase in fault attributed to the motorcyclist is shown in the following 6 of 10 crash types.

- Single Motor Vehicle
- Rear End
- Sideswipe Same Direction
- Rear End – Right Turn
- Rear End – Left Turn
- Other/Unknown

A decrease in fault attributed to the motorcyclist is shown in the following 3 of 10 crash types.

- Angle
- Sideswipe Opposite Direction
- Head On – Left Turn

No change in fault compared to severity is shown in the following crash type.

- Head On

Michigan reported 208,544 registered motorcycles and 488,555 endorsed operators in 2004. This equates to 2.34 endorsed operators for every registered motorcycle.

- 4.8% of the crashes indicate the motorcycle operator did not own the motorcycle.

Alcohol and/or drug use was nearly identical for motorcycle operator fatalities (38.2%) when compared to the driver fatalities in ALL traffic crashes (39.8%).

However, alcohol and/or drug use was OVERREPRESENTED in terms of occurrence in all motorcycle crashes.

- 7.5% of all motorcycle operators involved in a crash indicate some level of alcohol and/or drug use.
- Only 2.4% of all drivers involved in ALL traffic crashes indicate some level of alcohol and/or drug use.

In 9.3% of all motorcycle crashes, the operator of one of the vehicles reported that they “did not see” the other vehicle. This was predominately the case with the operator of the vehicle that struck the motorcycle.

Conclusions and Recommendations

Based on an analysis of motorcycle crashes in Michigan, the following conclusions and recommendations have been formed.

Historically, operating any type of vehicle on the road was a risk and remains so today. Even with traffic fatalities decreasing, the overall number of crashes is increasing. This is true for all traffic crashes, specifically motorcycle crashes. While an individual's chance of being killed in a traffic crash has dramatically decreased over the last 40 years, traffic fatalities still remain a leading cause of death for teenagers and young adults. There were 10,112,620 people living in Michigan in 2004. For every person living in Michigan, 1 of 8,725 was killed in a traffic crash and 1 of 110 was injured. In addition to the tragic loss due to death or injury, the annual economic cost is in the billions.

The last four decades have seen improvements to roadway design and road construction materials. There have been major improvements to the automobile, specifically motorcycles. Motorcycles have evolved from a vehicle that required the operator to pedal in order to begin self sustained operation, to fuel injected, 2000+ cc engines capable of propelling the operator in excess of 200 mph. The number of motor vehicles on the road has steadily climbed since WWII. Traffic congestion was a fact then depending on where one was traveling and remains a fact today. New transportation systems are coming online today assisting the traveler in warning of traffic backups ahead and transportation officials in the most efficient use of re-routing traffic around specific problem areas.

With all the improvements realized during the past 40 years, the motorcycle remains the most dangerous vehicle to operate on the roadway. While it is probably not possible to revolutionize the motorcycle into the safest mode of transportation, it does not have to be as risky as it is. In the hands of a properly trained and experienced rider, the typical street legal motorcycle can out perform any street legal automobile on the road. In the most typical conditions where the motorcyclists operate today and from an engineering standpoint, a well maintained motorcycle can stop quicker, accelerate faster, and out maneuver its four-wheeled counterpart.

Riding a motorcycle is a rewarding and pleasurable experience and also makes sense from an economical standpoint. Motorcycles reduce fuel consumption and bring welcome vacationing tax dollars into the state's economy.

There is no good reason that this most favorite mode of transportation for some, should end so tragically with a crash. The ONE overriding reason why it does for so many is skill or lack of it.

The only area that has not shown significant improvement over the last 40 years is the area surrounding the operation of the motorcycle. Motorcyclists continue to crash for the same reasons they did four decades ago.

Five critical areas have been identified as a result of this analysis.

1. There is critical void in available data collection and analysis. Traffic Crash reports lack relevant, necessary, and specific information in two critical areas.
 - Injury location and severity
 - Road design and engineering factors
2. There is no current data available allowing a determination to be made in reference to motorcycle training. It is strongly recommend that an analysis of trained vs. untrained

motorcycle operators be undertaken. In addition, the study should include an evaluation of current motorcycle safety training to ascertain its effectiveness.

3. The most common type of motorcycle crash is the Single Motor Vehicle crash. This crash type is OVERREPRESENTED when compared to all motor vehicle crashes. The significant issues surrounding SMV crashes are:
 - A failure to negotiate a curve or a loss of control on a straight road due to excessive speed
 - A loss of control or inability to avoid a crash due to excessive speed, reckless operation, or careless/negligent operation.
4. The second most common type of motorcycle crash is the Angle crash. This crash type is also OVERREPRESENTED when compared to all motor vehicle crashes, although not to the extent of the SMV crash. The most significant issue associated with the Angle crash is:
 - A vehicle which fails to yield the right-of-way to the motorcycle by
 - Making a left turn into the path of the motorcycle
 - Driving into the path of the motorcycle at an intersection or leaving a private driveway or alley.
5. More than one-third (36.3%) of those motorcycle operators involved in a crash were unendorsed.
 - Unendorsed operators are also more often found at-fault in a crash
 - The younger the operator, the more likely they are to be unendorsed with the 16-24 age group having the highest unendorsed percentage rate (51.8%).

Based on these five critical areas the following is recommended.

The first area concerns data collection.

1. Revise the current Official Traffic Crash Report (UD-10) to include:
 - Information on specific injury location and severity for each driver and vehicle occupant. A suggestion would be a diagram of the body separated into groups with each group assigned the severity code currently in place.
 - A – head
 - B – torso
 - C – arms
 - D – legs
 - Information specific to engineering or design issues such as:
 - Obstructions to vision such as vegetation, buildings, other traffic
 - Roadway flaws such as debris, uneven pavement, potholes, objects, oil or other contaminant, manhole covers, etc.

The second area concerns training and its effectiveness.

2. Implement or fund a study to determine the effectiveness of current motorcycle safety training and whether that training has any impact on crash rates. This study should also investigate and evaluate those involved in a motorcycle crash in reference to training, experience, countermeasures, and collision avoidance techniques used, if any.

The third area concerns actions specifically designed to reduce Angle crashes and Rear End crashes.

3. Amend MCL 257.684 of the Michigan Vehicle Code to require motorcycles to operate with headlamps illuminated at all times.

Amend MCL 257.685 of the Michigan Vehicle Code to specifically allow the use of headlamp modulators on motorcycles and encourage their use.

Note: MCL 257.698(4) currently allows vehicles to be equipped with lamps that meet the requirements of 49 C.F.R. 571.108. Headlamp modulators are specifically allowed under Federal Motor Vehicle Safety Standards and therefore allowed under MCL 257.698 but the connection should be more direct.

Petition the United States Department of Transportation to amend 49 C.F.R. 571.108 to specifically allow for brake light modulators on motorcycles. Federal law currently prohibits modulating brake lights, however, the National Highway Traffic Safety Administration currently recommends tapping the brake light to warn trailing vehicles of a reduction in speed or an impending stop.

The fourth area concerns the unendorsed motorcyclists. Over one-third of all motorcycle crashes involve an unendorsed motorcycle rider. If that ratio remains true in relation to all currently endorsed operators then there are theoretically over 177,000 motorcyclists operating without an endorsement in Michigan at one time or another. Studies show that a motorcyclist with the proper operator license/endorsement and training is LESS LIKELY to be involved in a crash.

4. Decrease the number of endorsed motorcyclists by any or all of the following methods.
 - Require the Michigan Department of State to cross check each new motorcycle registration or renewal with the registered owner and determine if he or she has a motorcycle endorsement. If the registered owner does not have a motorcycle endorsement, the registration will not be processed until the registered owner obtains an endorsement or signs a statement that the motorcycle will not be operated by him/her.
 - Develop a numbered decal with the letters "CY." The decal would be similar to a snowmobile or watercraft registration decal and applied to the operator's helmet. Require the operator of a motorcycle to obtain this decal when renewing or applying for a motorcycle endorsement. This would readily identify the operator as having the necessary operator license and endorsement.
 - Require an insurance company, prior to issuing a policy or binder, to verify that the applicant holds a valid endorsement or temporary instruction permit.

The fifth and final area returns to training. Studies show that training is related to traffic crashes. A properly trained operator is less likely to be involved in a crash and when involved in a crash, more likely to properly execute some type of collision avoidance maneuver. As stated earlier, these studies are dated and should be verified by a current study, but the basic premise is still valid. The state of Michigan should be encouraged to revise its current motorcycle endorsement requirements with any or all of the following recommendations.

5. Revise current motorcycle endorsement requirements.

Modify the current Temporary Instruction Permit (TIP) by implementing a Graduated Licensing (GDL) program for motorcyclist's age 16-24. Michigan's published data indicates that the GDL program reduces crash involvement for younger drivers.

- **Stage 1** would be valid for 90 days and have the following requirements/restrictions:
 - Completion of a recognized motorcycle safety training program
 - Operator to remain violation and crash free
 - 0.0% BAC
 - Limited to daylight hours
 - No passengers
 - Direct visual supervision by licensed/endorsed operator

- **Stage 2** would be valid for 180 days and have the following requirements/restrictions:
 - Entry skill level test
 - Operator to remain violation and crash free
 - 0.0% BAC
 - Exit advanced skill level test

The age group over 25 would require a TIP for a period no less than 90 days and have the following requirements/restrictions:

- Non-renewable
- Pass an advanced motorcycle skills test or show proof of successful completion of at least a Basic Rider Course (BRC) within the preceding 12 months. The holder of an expired TIP wishing to obtain another TIP would be required to again complete and pass at least a basic motorcycle safety course or its equivalent or successfully pass the advanced skill level test.
- 0.04% BAC maximum
- Remain violation and crash free

Special skills are needed to properly and safely operate a motorcycle and not everyone has these skills. Motorcycle operators must be properly qualified and better trained than the average motor vehicle operator. Nearly every vehicle a motorcyclist encounters on the road is larger, heavier, and better able to withstand a crash. Because the motorcycle will not afford them the luxury of crumple zones, safety belts, and air bags, the motorcyclist must rely on their own skill and ability to anticipate, understand, and avoid each potential threat as it develops on the road ahead.

Epilogue

When this analysis began, the question was asked, "Why study Michigan's motorcycle crashes?"

The following scenario will illustrate the answer in a real world perspective. Although the scenario is fictional the numbers are factual. It is for illustrative purposes only and not meant to depict actual people, specific places, or actual events. The events dramatized on April 1 compress 12 months of crash data into one night.

It is January 3 and halfway through a long, cold winter. You are 40 years old and been married for 20 years. You have two children, one in college and one a senior in high school. Although you are nearing retirement, you decide that you may have to stick around a little longer because the youngest also wants to go to college. All and all, life is good and you are pretty satisfied with where you are.

For Christmas this year your family decided to do something special for you in appreciation for all that you have done for them over the years. As you think back to that morning, you remember how surprised you were with their gift to you. In the garage was a brand new motorcycle. How did they know? Well, it's only that you have been talking about buying one for a while now. The household budget was doing pretty good and you could finally afford one. You smile to yourself as you remember the first time you ever rode. You were 15 and snooping around your grandfather's shed when you found it. It was covered in dust and cobwebs but it was beautiful! Then your grandfather walked in and just when you thought you were in trouble you notice the smile on his face. Pretty soon the two of you are cleaning off the dust and changing the spark plug. As the two of you work side by side, your grandfather tells you he will teach you to ride if you can get this thing running. So long ago but it still brings a smile to your face.

The cold January morning brings you back to reality as you walk to the mailbox. As you look through today's mail you cannot believe your eyes. What luck is this? Not only did you get a new motorcycle but you have been invited to the annual motorcycle riders' sports event. You have heard about this. Every year, each rider gets an invitation to a special sports event. Only motorcyclists are invited and seating is limited. This year the invitation is to a college hockey game at a Michigan university. What could be better, motorcycles and hockey. You talk it over with your wife and the two of you decide to go.

Now fast-forward ahead to April 1 and the weather is fantastic. It is almost 70 degrees outside, which is unusually warm for this time of year, but so much the better. As you ride into town for the game you are amazed at all the motorcycles. There must be half a million of them and they are all here for the game. Lucky for you that you have been here before and you know the way, otherwise you would probably never have a chance at getting into the game.

As you take your place in line and make your way forward you cannot stop thinking, I hope we get in. There are half a million motorcyclists in line and the arena only seats 4,000. It is first come-first served. The line is moving fast so you pull out your invitation and your driver license. Glad you remembered to bring them because they are your ticket. Now you near the head of the line and notice something strange. About every third person in line doesn't have a ticket and you are close enough now to hear their conversations. "I've been meaning to get my endorsement but just don't have the time...costs too much...I've been riding on this TIP for years..." On and on they go and what is amazing is the ticket master is letting them in anyway. That is 1,200 people without tickets. Oh well, it's for a good cause and what the heck, it's a beautiful night.

What you do not fully realize is that 1,200 out of the 4,000 people that will get into the game tonight do not have a motorcycle endorsement.

All of a sudden you are next. The ticket master looks at you and your wife's tickets and lets you through. The two of you are the last ones through. A friendly greeter gives you and your wife each a free gift. Wow, brand new hockey jerseys, one red and one blue. You look around and notice that everyone has a jersey, some red and some blue. Your wife's is numbered 3999 and you got number 4000.

At your seat you look out over the crowd, standing room only, every seat is taken, 4,000 people who love hockey and riding motorcycles. It is a sea of red and blue. You notice that the split appears to be about 50/50, 2,000 red and 2,000 blue jerseys. As you look around you notice that the jerseys have something written on them. The red say "FAULT" and the blue say "NO FAULT." That's odd, what strange names for the teams but...it's a beautiful night!

You are wearing a red jersey.

What you do not know is that everyone in the arena, ALL 4,000, will be involved in a motorcycle crash after the game. One-half will be at-fault.

The umpire moves to center ice and drops the puck. The game is on! Midway through the first period the concession people move through the crowd handing out drinks. Bill takes a nice cold beer but you decline. As you look around the arena you see about 300 people who are drinking alcohol. You think to yourself, I hope they're not driving when they leave here tonight but all of them will.

Out of the 4,000 people involved in a crash after the game, 300 will have consumed alcohol or have taken drugs just prior to their crash.

Near the end of the first period you notice that Bill seated next to you who was all smiles at the beginning of the game is now looking concerned, so you ask, "What's the matter Bill." Bill replies, "You know when I got here tonight I had a feeling I had been here before but how could that be. I've never made it through the door? Now I know I've been here before and something just doesn't feel right. I can't figure out what it is...oh well, it's a beautiful night, huh?"

It is the end of the first period. The game is tied 1 to 1. The announcer comes over the microphone... "Ladies and gentleman, can I have your attention please. Will the following people come down to center ice?" He begins to read off numbers. As their numbers are called, the smiling fans walk down the aisle and onto center ice. Some are husbands who leave their wives in the stands and some are wives leave their husbands in the stands. Some couples walk down together. You notice a few fathers and sons and some mothers and daughters, boyfriends, girlfriends, strangers, and acquaintances all headed out to center ice together. The announcer finishes after calling out 80 numbers. There at center ice, smiling and congratulating themselves, stand 80 people. Looking over at Bill you see he is NOT smiling. "What's the matter Bill?" Bill turns and looks back at you. "I'm remembering more now. I have been here before and this is not good."

As you turn and look back at center ice you see all 80 people heading off the ice through the opposing teams locker room door. You look around the arena and barely notice the 80 empty seats, but they are there. What Bill said begins to bother you a little.

What you do not know is that all those 80 people will die in a motorcycle crash after the game.

The second period is under way, Bill seems to be a little better, and the concession girl is back. This time she is taking everyone's keys. She apologizes but says that it is a requirement. There will be a drawing at the end of the game.

It is the end of the second period and the game is still tied. The announcer comes over the loud speaker again. "Will the following people please come to center ice?" He starts reading off numbers again. The last number he reads off is your wife's. She smiles and you both are excited as she steps onto the ice. Once again Bill looks uncomfortable. Down on the ice stand 3,000 excited fans who wonder what they have won. The 3,000 walk off the ice and out through the opposing team's locker room door. Outside the arena are 3,000 ambulances waiting to take those whose luck has run out to the hospital. As you contemplate what your wife has won the third period begins.

What you do not know is that all those 3,000 people, some riders and some passengers, will be injured in a motorcycle crash after the game, some seriously.

Well the game is almost over. The concession girl comes by a final time. She carries a small basket and is returning keys. As she approaches and returns Bill's keys you notice the key chain is bent and broken but for some reason Bill looks relieved. She reaches out and hands you your keys. They look fine and for some reason you are worried.

As the whistle blows to end the game you look around the arena. Wow, there are a lot of empty seats. Of the 4,000 that started the game only 920 remain filled.

Unknown to you, all those 920 people that remain will be involved in a crash after the game and although they will not be hurt their motorcycle will be damaged, some beyond repair.

With an uneasy feeling you wonder where your wife is as you make your way to the exit. There at the door you see her. She has a puzzled look on her face as you ask what she won. Her reply, "Nothing, everyone went outside and we stood around the parking lot next to these ambulances. They were parked there just waiting but we couldn't figure out why."

As you make your way to the parking lot you see Bill and waive good-bye. Bill looks sad but he waves nonetheless. Already he is beginning to forget he was here...just like he forgot after last year, the year he lost his wife at the game.

On your way home you approach the exit ramp from the freeway, the one to your subdivision. The ramp has a decreasing radius near the end, one that you hadn't really noticed in your car but tonight, on your new motorcycle, with your wife on the back, you take a little too fast. You are not speeding, just driving beyond your capabilities and once into the curve you realize this and mistakenly apply the brakes locking up the rear tire. The motorcycle loses traction and begins to slide. You make your second mistake and release the rear brake. Within a fraction of a second the rear tire regains traction and attempts to realign itself with the motorcycle's direction of travel. The movement is sudden and immediate and both you and your wife are thrown from the motorcycle.

The last thing you remember before losing consciousness is how strange it was to be followed all the way home from the game by an ambulance. Suddenly you are terribly frightened for your wife of 20 years as you see her lying on the ground and the motorcycle cartwheeling through the air directly toward her.

500,000+ riders
4,000+ riders and their passengers involved in a crash
3,080+ injuries including 80 deaths
920+ not injured but motorcycle damaged or destroyed

Each year, every year...

If we were to have a reunion of sorts and include all those riders and their passengers who have been involved in a motorcycle crash since 1966, we could fill every seat in Ford Field **twice** and Comerica Park **twice**, and still have 6,000 people waiting to get in.

APPENDIX A: Crash Table

**2004 Motorcycle Crashes
Injury B, C, and O**

County	#Units	Fatal Crashes	#Killed	Injury Crashes	#Injured	Prop Dmg Only	Date	Time	Crash Year	Road Condition	Driver Haz-Action	Weather	Road Relation	Traffic Control	Light	Crash Type	Injury Severity
Alcona County	1	0	0	1	1	0	05/09/04	04:00 PM	2004	Dry	None	Clear	Other/unknown	None	Daylight	Single Motor Vehicle	B
