SECTION III WORK STATEMENT

A. Brief Description of Work

The person selected for this assignment will perform the usual technical analysis functions to create the software and process documentation needed to support and maintain MDE applications and recommend process changes as needed.

B. Background on the work requested

MDE has several pending high/critical need projects that will employ the use of current IT resources. These resources are also involved in the production support maintenance to ensure the data collection deadlines are met, resulting in 100% current employee utilization. Many of the business rules and deadlines are mandated by the government. Failure to achieve compliance of the government regulations would jeopardize the financial assistance of the educational community.

The Michigan Department of Education has several projects and system updates underway in support of the P-20 education initiatives outlined in the Cherry Commission Report. Examples of these systems include an Item Banking system for the Office of Educational Assessment and Accountability, a Supplemental Education System for the Office of Special Education, a State Aid Payment Management System for the State Aid Office, etc. Some of these systems involve legislatively mandated deadlines such as the Teacher Certification system, which has a deadline of July 1, 2010. The MDIT Agency Services team needs additional resources to help document the software applications, systems, processes and procedures in support of all these projects and systems. The need for the additional resource arises because these projects are grant funded and therefore must be completed within the grant time frame even if multiple concurrent grants are awarded.

C. Objectives

Secure a Systems Analyst resource to analyze software, systems, processes and procedures and prepare technical documentation needed to support MDE projects and production systems.

D. Agency technical environment for the work

Broadly classified into three environments: - Development, Test and the Production Environment.

Operating System (all Servers): Windows XP Advanced Server.

Presentation Layer: IIS 5.1 with version 1.1 of .Net framework

Application Layer: VB.Net, ASP.Net, C#.Net, COM+/Server objects compiled in C++, and VB (version 6.0).

Database Layer: Microsoft SQL Server 2000/2005.

All code/report changes undergo a three-step process to be introduced into production:

1. First, code is developed and tested in the "development" stage, which is composed of the development database, application and SQL servers. Work will be performed utilizing tools on the local developer's machine, with copies on a network server for backup and recovery purposes.
2. Second, once development is completed, the code is moved to the System Test stage, which consists of Web servers, Networking Servers, SQL Server, and Windows XP authenticated workstations. Contractors will be given Read/Write authority on all these test servers as needed. The code is then tested for verification to ensure proper functionality.
3. Finally, once approval has been received, the code changes are promoted by DIT staff to the Production environment through Visual Source Safe where DIT staff will evaluate the code. The production environment is composed of database, application and web servers. Production pushes must be requested through the Remedy system.
