

# Operational and Economic Impacts of Hurricanes on Drinking Water Systems

Kim Linton  
Sr. Account Manager  
Water Research Foundation

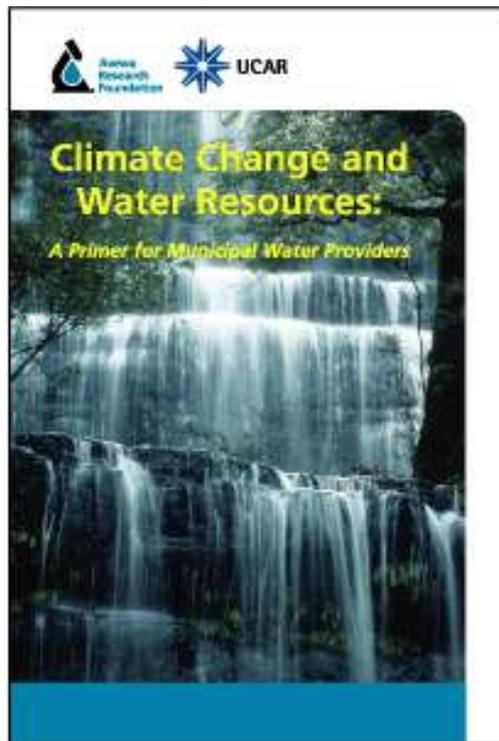

# The Water Industry's Research Source Since 1966

# Climate Change and Water Resources:

A Primer for Municipal Water Providers

AwwaRF publication 91120

- Current state of climate change research
- Assesses water supply vulnerabilities
- Case studies of water utilities planning for climate change.
- Lessons from extreme events such as wildfires; droughts; floods
- Develops range of adaptation strategies

# Humans and greenhouse gases

Carbon Dioxide  
(CO<sub>2</sub>) and Methane  
(CH<sub>4</sub>)

Now:

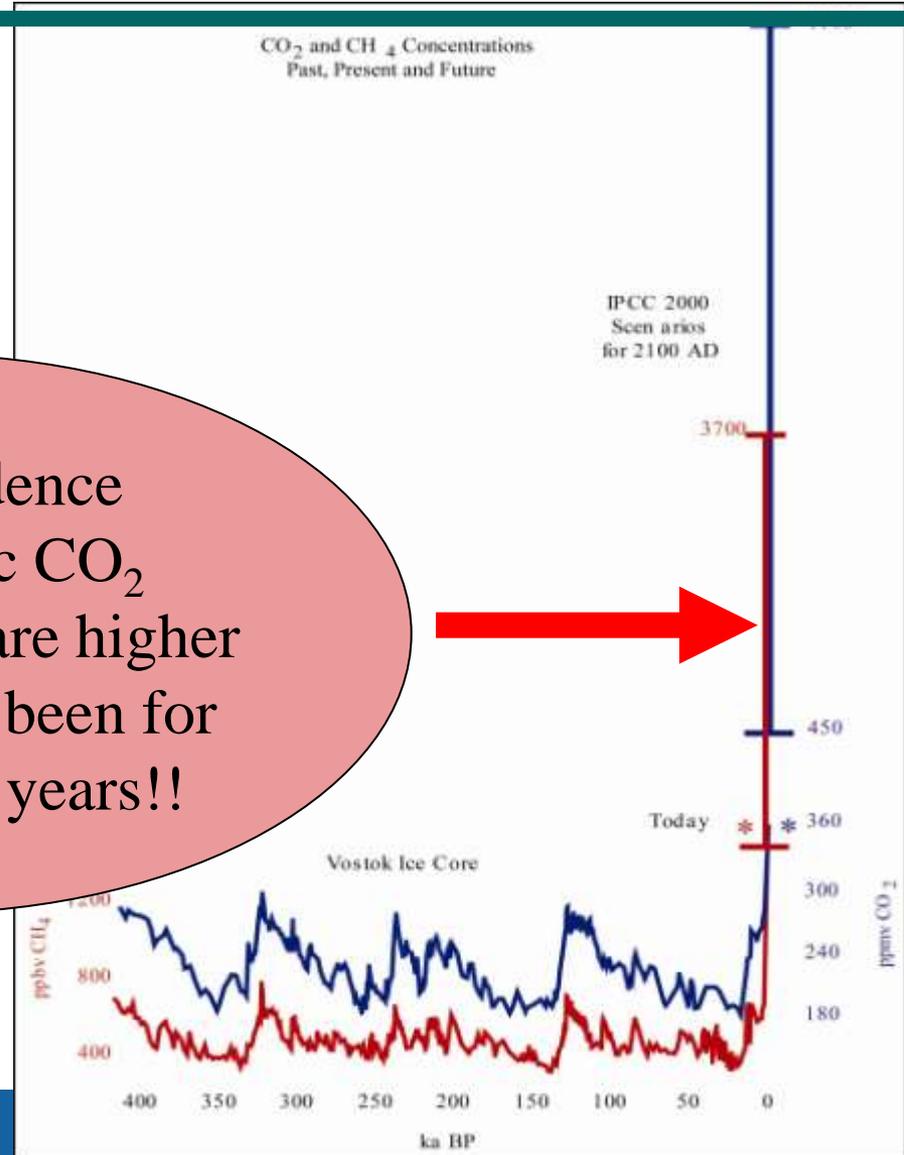

concentrations are

higher than

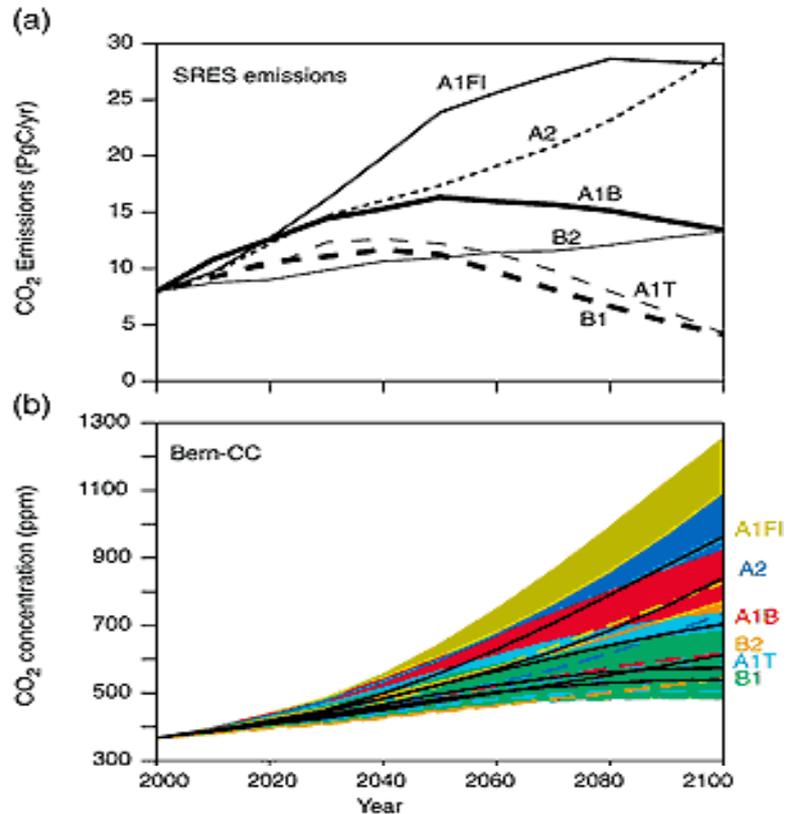

range over past

400,000 years

Strong evidence  
Atmospheric CO<sub>2</sub>  
concentrations are higher  
than they have been for  
400 thousand years!!

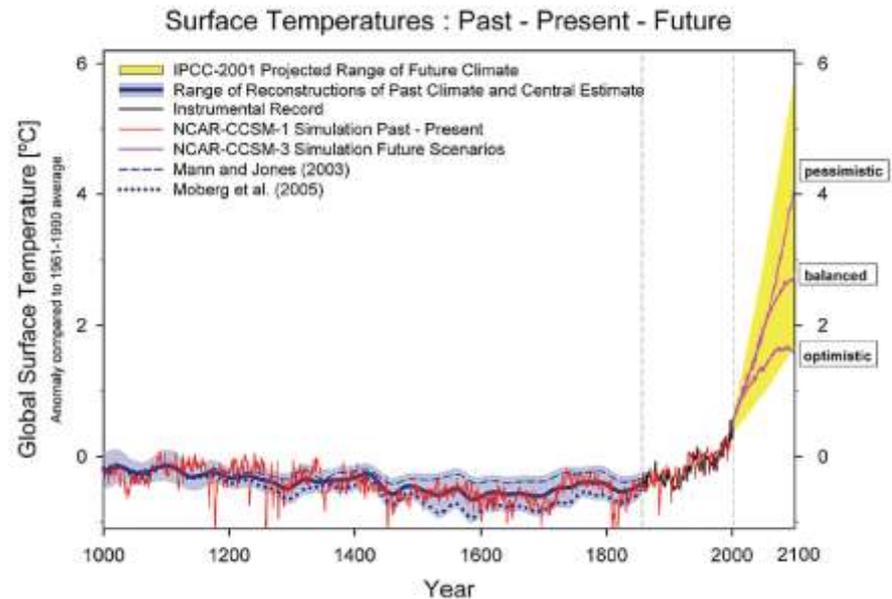

# Warming will depend on emissions

Possible range of carbon dioxide emissions and the resulting changes in atmospheric carbon concentrations.

Major source of uncertainty:  
Future path of development,  
technology & policy

# Melting Ice in Greenland

A satellite image of Greenland's ice sheet taken on July 8, 2012, depicts a large core of solid ice (white) surrounded by areas of melted ice (dark pink) and probable melted ice (light pink).

Nicolo E. DiGirolamo,

# Amount of Time Required for Systems to Become Fully Operational Following Hurricane Irene

# Types of Problems Experienced During and Following the Storm

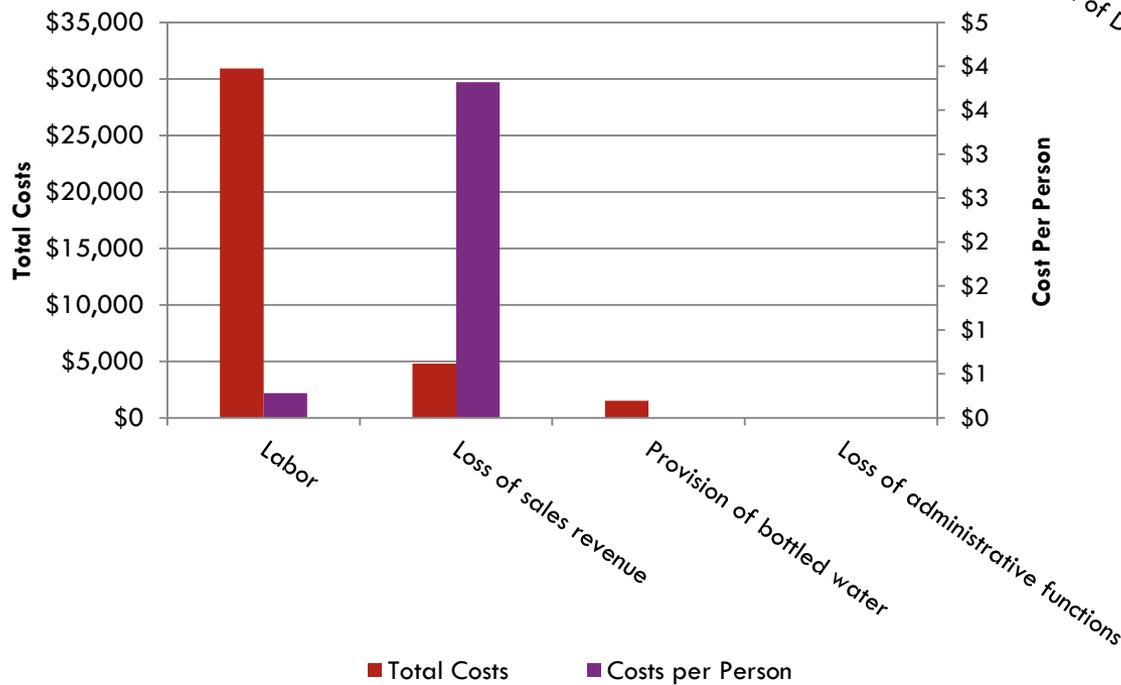

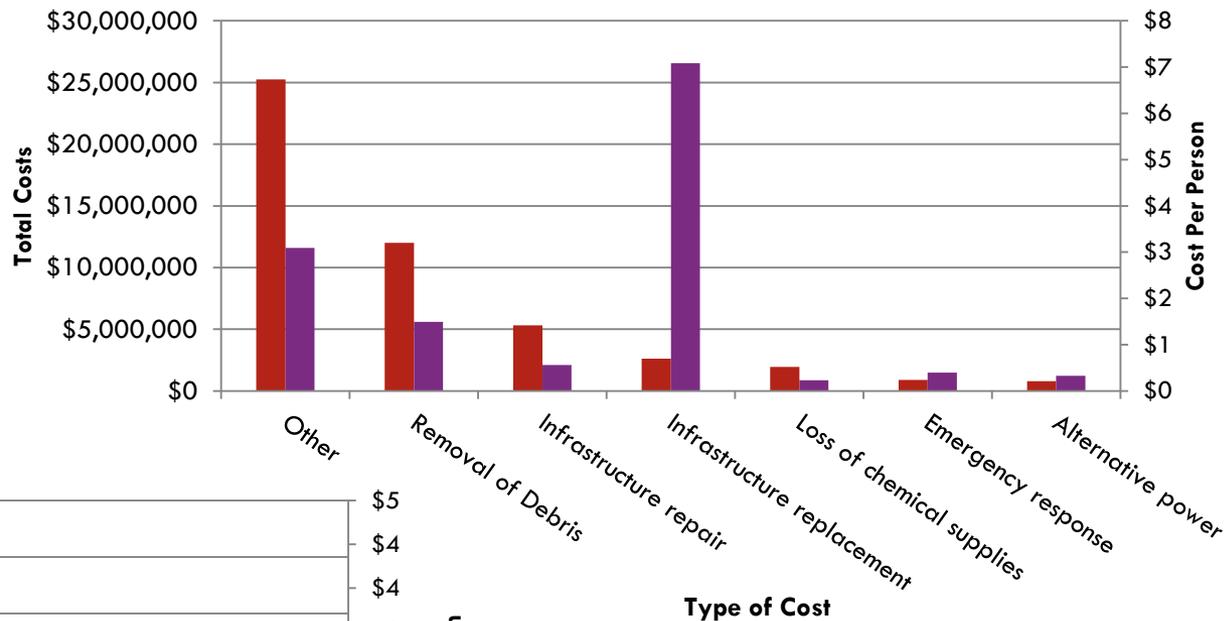

Note: Several respondents reported more than one impact in the figure above.

# Cost Summary

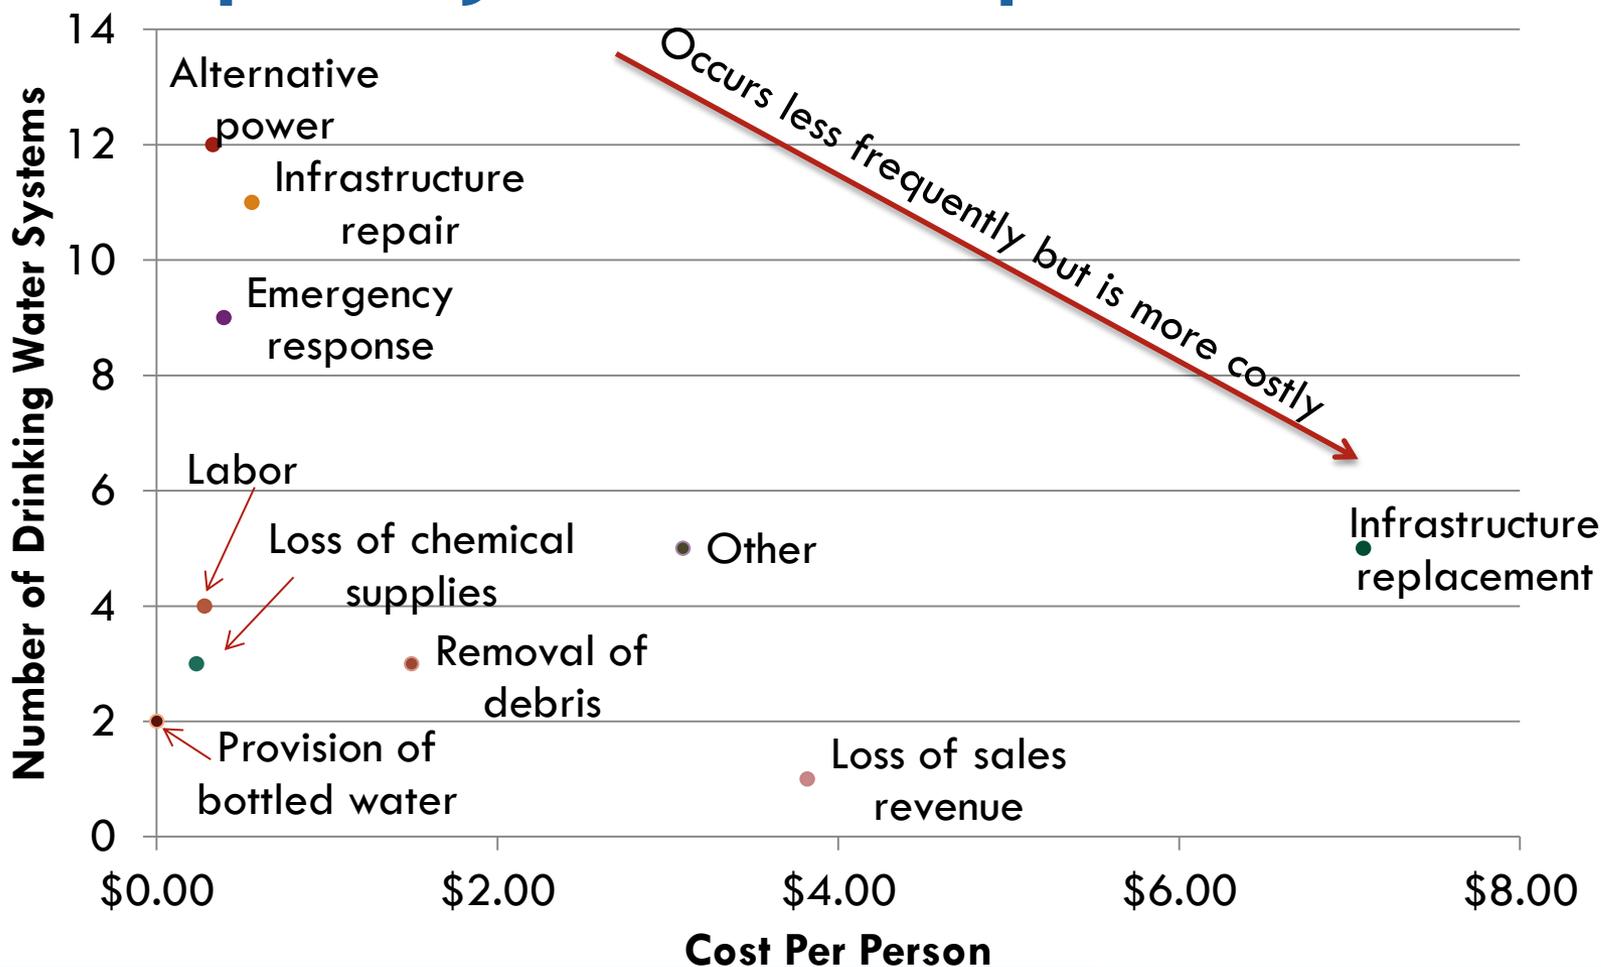

| Item  | Per Utility                  | Average                |
|---|------------------------------|------------------------|
| Greatest total cost                           | \$40 million / 1 utility     | \$5.37 / person        |
| Average cost for impacts reported             | \$2.3 million / 38 utilities | \$4.60 / person        |
| Average cost for all utilities responding     | \$751,878 / 65 utilities     | \$3.33 / person        |
| Highest cost - A - infrastructure replacement | \$2,609,000 total            | \$521,800 avg./5 ut. - |
| Alternative energy costs                      | \$792,000 total              | \$66,000 avg. / 12 ut. |

A - replacement of water treatment, storage, or distribution system equipment or components

# Magnitude of Costs Reported by Drinking Water Systems

# Lessons Learned and Recommendations

Transmission main washout  
*Photo courtesy of Jim Glozzy*

- An increased sampling regimen - most frequently reported precaution.
  - Prepare by having water sampling supplies on hand.
- Additional staff/staff hours required....can be costly.
  - Prepare a staffing plan for emergencies
  - Establish clear expectations with vendors and contractors
- Communication is key.
  - Establish clear channels of communication with regulators, neighboring drinking water systems, other utilities, media outlets, and other local emergency responders.
- Road Blocks (literally) are inevitable
  - Include evacuation and alternate access routes to assist crews during emergency situations in your emergency response plan.

## Example Preparation Checklist Actions, United Water

- Prepare staffing availability schedule for all departments
  - Employees Safety and Customer Service
- List of emergency generators and their current locations
  - Locate portable generators at key locations in case of transportation issues
  - Test run all generators and top off fuel tanks
  - Contact (via RCOEM) the National Guard for generator availability
- Test Emergency Hydraulic Pump
- Perform Dam Inspections
- Prepare water quality check list
  - Top off all treatment chemicals
  - Keep chlorine residuals elevated in case of sewage run-off
  - Clean and calibrate turbidimeters, flush head loss gauges
  - Prepare for jar testing to confirm coagulant dosages
  - Coordinate sampling procedures with Haworth lab
  - Maintain high level in storage tanks

# Financing an Emergency

*Photo courtesy of Susan Licardi*  
**Electrical flooding at well house**

- Medium-sized systems (3,301-10,000) - greatest per person cost as a result of Hurricane Irene.
- Small systems (<3,301) - most vulnerable to increased operating costs as a result of Hurricane Irene.
- FEMA reimbursements can take time;
  - Develop a business continuity plan/contingency plan
  - Work with your FEMA representative ASAP
    - photo log of your damages.
- Insurance coverage (actual and required) will impact your emergency response funding eligibility. Determine if your insurance coverage is appropriate.

## Requesting Reimbursement in New Haven, Conn.

- Regional Water Authority in New Haven, Conn. requested relief funding from FEMA following Hurricane Irene.
- It took nearly three months for FEMA to contact the drinking water system regarding their application.
- System heard back from FEMA in November, delays experienced working through the required documents due to the holiday schedule.
- The Regional Water Authority suggested:
  - maintaining good expense records would improve the request process.
  - taking photos during the event serves as a helpful reminder about who was involved at any given point and what equipment was used.

# Partnerships and Planning

Road block due to storm damage  
*Photo courtesy of John Triana*

- **Strategic partnerships** can provide drinking water systems with support and resources needed to address unexpected failures during an emergency.
  - Utilities, Department of Public Works, and Public Service providers in neighboring towns can help supplement the local availability of emergency assistance.
  - Regulators and local government officials
  - Utilities providers (electricity)
- **After Action Report** Document your lessons learned
- **Plan regularly and practice more often**, including reviewing safety measures with staff frequently.

## Sample After-Action Report (Norwich Public Utilities, Connecticut)

### **1. Pre-Storm Checklists:**

- Update Pre-storm Checklists with lessons learned

### **2. Emergency Plans**

- Update Incident Command Structure (ICS) plans with lessons learned from storm
- Communicate safety chain of command
- Issue Storm chart Org chart with backups
- Other resources allocated through ICS
- Procedure / Guideline for declaring NPU emergency

### **3. Stockroom**

- Procure more air mattresses
- Have additional cell phone vehicle chargers on hand
- Add more staff in stockroom during storm
- Have necessities available for employee families (Water, flashlights cots etc.)

### **4. Contractor and Mutual Aid**

- Create system overview, standards and safety guidelines package
- Train all contractors and mutual aid crews prior to starting work
- Improve checking in / checking out procedure

## Sample After-Action Report (Norwich Public Utilities, Connecticut)

### **5. Communication Improvements**

- Investigate communication systems or tools for coordinating Field control room and EOC
- Post storm status in public areas for crews and employees
- GIS map updated and available CS & EOC
- Hold morning tailgates prior to starting work day
- Radio communication
- Engage new tools - Twitter, Face book, outbound calling, website other
- PowerPoint updates in lunchrooms and EOC
- Provide customers with pre storm communication and safety information

### **6. Damage assessment teams**

- Utilize crews of two whenever possible.
- Provide sectionalized circuit maps for assessment teams
- Train additional people (Meter readers and others) and utilize non-trained as drivers
- Investigate Trimble handhelds as solution for communicating damage

## Sample After-Action Report (Norwich Public Utilities, Connecticut)

### 7. EOC improvements:

- Increase clerical staffing
- Train in ICS, roles and responsibilities, with all necessary departments present
- Perform tabletop drills more frequently 1-2 times per year

### 8. Facilities Hardening:

- Investigate Hurricane Windows or shutters for EOC
- South Golden Street Generator
- CNG Generator
- Install generator at Royal oaks pump station
- Fiber system on generators
- At plants test generators under load monthly
- Obtain sandbags in advance
- Add transfer switch and quick generator connect at well site

### 9. Equipment

- Additional portable light trailer / generator
- Individual tracking of assignments and equipment used

## Additional point:

Staff safety issues faced by the water systems and how those should be incorporated into their preparedness planning.

In many cases, the conditions of the storm prevented water system staff from addressing problems during the storm.

Following Hurricane Irene, one water system revised the maximum wind speed under which they would allow staff to go outside.

# Conclusions: Partnerships and Planning

- **Strategic partnerships** can provide drinking water systems with support and resources needed to address unexpected failures during an emergency.
  - Utilities, Department of Public Works, and Public Service providers in neighboring towns can help supplement the local availability of emergency assistance.
  - Regulators and local government officials
  - Utilities providers (electricity)
- **After Action Report** - Document lessons learned
- **Plan and practice** - Include reviewing safety measures

## Mutual Aid and Assistance

[WARN Home](#) | [WARN Resources](#) | [Tabletop Exercises](#) | [Additional Resources](#)

In coordination with the water sector, the Environmental Protection Agency is supporting a number of projects to promote the use of mutual aid and assistance in response to any event that overwhelms a utility's resources.

### Water/Wastewater Agency Response Network (WARN)

A Water and Wastewater Agency Response Network (WARN) is an intrastate network of "utilities helping utilities" to respond to and recover from emergencies by sharing resources with one another. The WARN framework provides a forum for maintaining emergency contacts, providing expedited access to specialized resources, and facilitating training on resource exchange during an emergency. The American Water

Works Association published a white paper, titled [Utilities Helping Utilities: An Action Plan for Mutual Aid and Assistance Networks for Water and Wastewater Utilities](#), [EXIT Disclaimer](#) to provide utilities with the basic building blocks for developing a successful WARN.

At the heart of WARN is a standardized [Mutual Aid and Assistance Agreement](#), [EXIT Disclaimer](#) which outlines the terms through which utilities provide resources to one another. The agreement covers key issues such as

You will need Adobe Reader to view some of the files on this page. See [EPA's PDF page](#) to learn more.
