SUBJECT: Green Project Reserve for SRF 5471-01 Swift Run Drainage District Storm water Best Management Practices

This is a nonpoint source (NPS) State Revolving Fund (SRF) project that is part of a comprehensive plan by the Washtenaw County Water Resources Commission to mitigate nonpoint source pollution. The Middle Huron Watershed is under a Total Maximum Daily Load (TMDL) restriction for phosphorus, suspended solid and E. coli bacteria. Storm water had been demonstrated to be a significant contributor of nutrients, sediment and bacteria.

This project is part of a Middle Huron River plan to improve water quality by reducing storm water runoff and meet the TMDL goals for reduction of phosphorus, total suspended solids, and bacterial contamination. The project will plant approximately 180 trees in the Swift Run Drainage District and will aid in water and nutrient uptake, therefore reducing the flow of storm water.

All components of this project qualify as Green Project Reserve (GPR) as per EPA GPR guidance, Part A – CWSRF GPR Specific Guidance, CWSRF Technical Guidance, Green Infrastructure, subpart 1.2-6 "Comprehensive retrofit programs designed to keep wet weather discharges out of all types of sewer systems using . . . trees and urban reforestation, . . .". The total approved loan amount is \$55,000. The GPR forgiveness amount is \$27,500.
