Subject: Gelman - Periodic DEQ Update - Downgradient Investigation

The boring for MW-103 (at Abbott & Glendale) is proceeding. Seven samples from water bearing units have been analyzed, starting at 59 feet; available results of 1,4-dioxane sampling follow:

59' deep, 11 parts per billion (ppb)
69' deep, 8 ppb
79' deep, 5 ppb
89' deep, non-detect
99' deep, non-detect
109' deep, non-detect
119' deep, 4 ppb

Drilling started up again this morning. Once the boring is completed we anticipate that a set of two monitoring wells will be installed, MW-103s & MW-103d.

Please contact me if you have any questions.
