Unit E Aquifer Drilling Results and Schedule

MW-100 (south of Valley near Pinewood) was installed near the base of the aquifer from 218-223 feet. Vertical profiling at this location did not detect any 1,4-dioxane from 90 to 140 feet. Two samples from 210-221 feet, below a clay layer, each showed 2 parts per billion (ppb). This is located near IW-2, a former injection well, which has had detections of 1 to 2 ppb for the past four years.

Yesterday PLS began drilling for installation of a set of nested monitoring wells on the west side of Maple, north of Dexter. They are likely to be working at this location for about a week.

Please contact me if you have any questions.
