Hepatitis B Reporting Flowchart

**Acute**

HBsAg positive and IgM Anti-HBc positive (if done)

Yes

Acute illness with discrete onset of symptoms and either a) jaundice or b) elevated ALT levels >100 IU/L

Yes

Consider Chronic Hepatitis B

Confirmed Acute Hepatitis B

No

Superceded = used when closing chronic hepatitis B cases (and after verification of pregnancy for women of childbearing age) who were previously entered in MDSS as a chronic hepatitis B.

Cancelled = used when a case is not a reportable condition or client lives in another state.

Not a case = used if a case does not meet case definition for acute or chronic hepatitis B, otherwise use probable or confirmed.

Confirmed = meets case definition of an acute or chronic case.

Completed – Follow up = used to update information on a previously completed investigation. Cases must be Completed or Completed – Follow up to be reported to CDC.

Please include ordering physician and telephone number on lab tab for all HBsAg positive lab reports.

**Chronic**

A positive result in any of the following: HBsAg or HBeAg or HBV DNA

Yes

Consider Acute Hepatitis B

No

IgM Anti-HBc positive

Yes

Confirmed Chronic Hepatitis B

Not done

Probable Chronic Hepatitis B

No

Two positive results at least 6 months apart in any of the following: HBsAg or HBeAg or HBV DNA
**Hepatitis B, Acute – 2012 Case Definition**

**Clinical Description**
An acute illness with a discrete onset of any sign or symptom* consistent with acute viral hepatitis (e.g., fever, headache, malaise, anorexia, nausea, vomiting, diarrhea, and abdominal pain), and either a) jaundice, or b) elevated serum alanine aminotransferase (ALT) levels >100 IU/L.
*A documented negative hepatitis B surface antigen (HBsAg) laboratory test result within 6 months prior to a positive test (either HBsAg, hepatitis B “e” antigen (HBeAg), or hepatitis B virus nucleic acid testing (HBV NAT) including genotype) result does not require an acute clinical presentation to meet the surveillance case definition.

**Laboratory Criteria for Diagnosis**
HBsAg positive, AND Immunoglobulin M (IgM) antibody to hepatitis B core antigen (IgM anti-HBc) positive (if done)

**Case Classification**
**Confirmed**
A case that meets the clinical case definition is laboratory confirmed, and is not known to have chronic hepatitis B.

**Hepatitis B, Chronic – 2012 Case Definition**

**Clinical Description**
No symptoms are required. Persons with chronic hepatitis B virus (HBV) infection may have no evidence of liver disease or may have a spectrum of disease ranging from chronic hepatitis to cirrhosis or liver cancer.

**Laboratory Criteria for Diagnosis**
Immunoglobulin M (IgM) antibodies to hepatitis B core antigen (IgM anti-HBc) negative AND a positive result on one of the following tests: hepatitis B surface antigen (HBsAg), hepatitis B e antigen (HBeAg), or nucleic acid test for hepatitis B virus DNA (including qualitative, quantitative and genotype testing), OR HBsAg positive or nucleic acid test for HBV DNA positive (including qualitative, quantitative and genotype testing) or HBeAg positive two times at least 6 months apart (Any combination of these tests performed 6 months apart is acceptable)

**Case Classification**
**Probable**
A person with a single HBsAg positive or HBV DNA positive (including qualitative, quantitative and genotype testing) or HBeAg positive lab result and does not meet the case definition for acute hepatitis B.

**Confirmed**
A person who meets either of the above laboratory criteria for diagnosis.

**Comment**
Multiple laboratory tests indicative of chronic HBV infection may be performed simultaneously on the same patient specimen as part of a “hepatitis panel.” Testing performed in this manner may lead to seemingly discordant results, e.g., HBsAg-negative AND HBV DNA-positive. For the purposes of this case definition, any positive result among the three laboratory tests mentioned above is acceptable, regardless of other testing results. Negative HBeAg results and HBV DNA levels below positive cutoff level do not confirm the absence of HBV infection.
