AVIAN INFLUENZA A (H7N9)
Human infections with avian influenza A (H7N9) in China continue to be reported. Cases have been confirmed in 8 contiguous provinces in eastern China, 2 municipalities (Beijing and Shanghai), and Taiwan (1 case, exposed in China). To date, 25% of cases have died. Testing of more than 20,000 Chinese who had flu-like illness turned up only six cases of H7N9 infection (0.03% positive). One province, Guangdong, has no human cases but has identified an infected chicken. This is the first province where animals are the sentinels of the virus for humans and not vice versa. The Chinese Center for Disease Control and Prevention is updating case counts weekly. There is still no obvious epidemiological links or sustained human-to-human transmission. There is no recommendation against travel to China at this time.
