The Michigan Behavioral Risk Factor Survey (MiBRFS) is an annual, statewide telephone survey of Michigan adults aged 18 years and older that is conducted through a collaborative effort between the Population Health Surveillance Branch (PHSB) of the Centers for Disease Control and Prevention (CDC), the Michigan State University Institute for Public Policy and Social Research (IPPSR), and the Michigan Department of Health & Human Services (MDHHS). Michigan Behavioral Risk Factor Surveillance System (MiBRFSS) data contribute to the CDC Behavioral Risk Factor Surveillance System (BRFSS) that is conducted within every state, the District of Columbia, and several U.S. territories.

In 2014, the MiBRFS collected data from both landline and cell phone respondents. The sample of landline telephone numbers was selected using a list-assisted, random-digit-dialed methodology with a disproportionate stratification based on phone bank density, and whether or not the phone numbers were directory listed. The sample of cell phone numbers was randomly selected from dedicated cellular telephone banks sorted on the basis of area code and exchange.

A weighting methodology known as iterative proportional fitting or raking was used in 2014 to allow for the incorporation of cell phone data and to improve the accuracy of prevalence estimates based on MiBRFS data. Estimates based on this weighting methodology were weighted to adjust for the probabilities of selection and a raking adjustment factor that adjusted for the distribution of the Michigan adult population by telephone source (landline or cell phone), detailed race/ethnicity, education level, marital status, age by gender, gender by race/ethnicity, age by race/ethnicity, and renter/owner status.

Due to the BRFSS methodology changes that were implemented in 2011, the 2014 MiBRFS estimates provided within this report should only be compared to estimates from 2011-2013 and not to estimates from years prior to 2011.

Prevalence estimates and asymmetric 95% confidence intervals (95% CIs) were calculated using SAS-Callable SUDAAN (version 11.0.1), a statistical computing program that was designed for analyzing data from multistage sample surveys. If the 95% CIs for two estimates from different subpopulations or survey years did not overlap, they were considered to be statistically different. Unless otherwise specified, respondents who answered that they did not know or refused to answer were not included in the calculation of estimates. For comparison purposes, the median estimates from all 50 states and the District of Columbia were used as national estimates.

In addition to this report, the MiBRFSS releases several additional publications each year. These publications provide statewide health estimates for Michigan adults as well as estimates among demographic and geographic subpopulations. MiBRFSS Surveillance Briefs are also published on a quarterly basis and highlight new topical data from the MiBRFSS, including data from MiBRFSS state-added questions. All of these publications can be found on the MiBRFSS website (www.michigan.gov/brfs).

Sample Results for the 2014 MiBRFS

The total sample size for the 2014 MiBRFS was 8,466 (landline = 4,973; cell phone = 3,493). The response rate for the landline portion of the 2014 MiBRFS was 50.3%, while the response rate for the cell phone portion of the survey was 41.6%. The overall weighted response rate (landline and cell phones combined) for the 2014 MiBRFS was 47.8%. The overall weighted U.S. median response rate for 2014 was 47.0%.

Over the past several years, MDHHS has been able to maintain an annual MiBRFS sample size of at least 8,000 completed interviews. A larger annual sample size increases the utility of the survey by providing more precise estimates, allowing for an increased number of topics to be covered each year, and enables the calculation of estimates for more demographic and geographic subpopulations.
This report presents estimates from the 2014 MiBRFS, a statewide landline and cell phone survey of Michigan residents aged 18 years and older. It is the only source of state-specific, population-based estimates of the prevalence of various health behaviors, medical conditions, and preventive health care practices among Michigan adults. The survey findings are used by public health agencies, academic institutions, non-profit organizations, and others to develop programs that promote the health of Michigan citizens.

All of the results from the 2014 MiBRFS presented within this report have been weighted as described in the methods section and can be interpreted as prevalence estimates among the Michigan adult population. Due to the BRFSS methodology changes that took place in 2011, these estimates should only be compared to MiBRFS estimates from 2011-2013 and not to MiBRFS estimates from years prior to 2011.

Selected Risk Factors - 2014 CDC BRFSS
U.S. vs. Michigan
Public Health Implications of Findings

A number of themes emerge from the findings of the 2014 MiBRFS that have implications for public health.

**Michigan is making great strides in increasing access to health care coverage.**

In 2014, an estimated 12.7% (95% CI: 11.6-14.0) of Michigan adults aged 18-64 years reported not having any form of health care coverage. This represents a significant decrease of 4.7 percentage points from the 2013 prevalence of 17.4% (95% CI: 16.3-18.6). From 2013 to 2014, the prevalence of no health care coverage decreased among males (2013: 21.0% vs. 2014: 15.1%) and females (2013: 13.8% vs. 2014: 10.3%), as well as White, non-Hispanic (2013: 15.4% vs. 2014: 11.3%) and Black, non-Hispanic adults (2013: 26.4% vs. 2014: 17.6%). The Healthy Michigan Plan, which was implemented on April 1, 2014, makes health care benefits available to individuals at a low cost. As the Healthy Michigan Plan continues, we hope to observe further decreases in the number of Michigan adults aged 18-64 years who report not having any form of health care coverage.

**Multiple chronic conditions continue to be a problem among Michigan adults.**

In 2014, an estimated 29.1% of Michigan adults reported that they had ever been told by a doctor that they had two or more of the following chronic health conditions: diabetes, cardiovascular disease, current asthma, COPD, cancer, arthritis, kidney disease, and/or depression. Furthermore, an additional 27.3% reported ever having only one of these chronic health conditions. The prevalence of multiple chronic conditions increased with age, and was significantly higher among females (32.2%) than males (25.8%). The prevalence of multiple chronic conditions was similar by race/ethnicity, but was significantly higher among the less educated and lower household income groups. Through public health efforts, such as the Million Hearts initiative, MDHHS chronic disease programs continue to work collaboratively toward reducing the burden of these chronic conditions within the Michigan adult population.

**Racial disparities in weight status among Michigan adults have diminished.**

In 2014, an estimated 30.7% of Michigan adults were classified as being obese (BMI ≥ 30.0), which is similar to the 2013 prevalence of 31.5%. For the past several years, Black, non-Hispanic adults have reported significantly higher obesity prevalence estimates than White, non-Hispanic adults. In 2014, this disparity diminished with the prevalence of obesity among Black, non-Hispanic adults (33.6% [95% CI: 29.6-37.7]) being similar to that of White, non-Hispanic adults (30.2% [95% CI: 28.8-31.6]). In addition to targeting Michigan’s high burden populations, the Michigan Nutrition, Physical Activity and Obesity Program continues to develop programs that focus on improving nutrition and increasing physical activity among the entire Michigan population.

**Smoking and secondhand smoke exposure have stabilized, but more progress is needed.**

In 2014, an estimated 21.2% of Michigan adults reported that they currently smoke cigarettes on a regular basis, which is similar to the 2013 current smoking prevalence of 21.4%. Unfortunately, this means that one in every five Michigan adults currently smoke cigarettes. Even with the passage of the Michigan Smoke-free Air Law on May 1, 2010, secondhand smoke exposure continues to be a problem in Michigan with an estimated 24.9% of adults reporting that they were exposed to secondhand smoke in their home or in a car within the past seven days. When focusing only on non-smokers the prevalence of secondhand smoke exposure during the past seven days decreases to 15.4% (95% CI: 13.9-17.2). With a sustained emphasis on smoking cessation and smoke-free regulations, the MDHHS Tobacco Program anticipates that the prevalence of smoking and secondhand smoke exposure will start to decrease again within the coming years.

**Binge drinking among Michigan adults remains higher than the U.S. median.**

In 2014, an estimated 18.9% of Michigan adults reported having at least one binge drinking episode within the past month. The prevalence of binge drinking among Michigan adults is significantly higher than the U.S. median binge drinking prevalence (16.0%). With exception of the 2010 survey year, the prevalence of binge drinking among Michigan adults has been higher than the U.S. median for the past decade. MDHHS’ Alcohol Surveillance Program provides data and statistics to local health departments and organizations committed to reducing adverse impacts of excessive alcohol consumption through the use of environmental and policy interventions described within the Guide to Community Preventive Services (http://www.thecommunityguide.org/index.html). MDHHS programs work in concert with local coalitions and other stakeholders to address excessive alcohol consumption throughout the state.
Future of the Michigan Behavioral Risk Factor Survey

The target sample size for the 2015 MiBRFS is 8,400 total completed interviews. Of these 8,400 interviews, 4,200 will be completed with landline respondents, while the remaining 4,200 will be completed with cell phone respondents. The 2015 questionnaire will include approximately 50 state-added questions on numerous topics, including cognitive decline, binge drinking, family planning, food access, social context, and cancer survivorship. The full 2015 MiBRFS questionnaire is available on the MiBRFSS website (www.michigan.gov/brfs).

The BRFSS continues to adapt to challenges and expand its utility. The representativeness and validity of MiBRFS estimates has been improved. For example, due the drastic increase in the utilization of cell phone communication, the BRFSS now collects approximately half of the data from cell phone respondents. Furthermore, the CDC has implemented a new raking weighting methodology so that BRFSS estimates are more representative than ever before. Michigan has also expanded the utility of the MiBRFS through the following projects:

- The maintenance of a larger MiBRFS sample size will allow for more precise estimates among racial/ethnic populations, especially when multiple years of data are combined.
- In 2014, a standalone BRFSS-like oversample survey was conducted among the Hispanic/Latino adult population within Michigan. Results from the 2012 Michigan Hispanic/Latino standalone survey and the 2013 Michigan Arab/Chaldean standalone survey have been released and are available on the MiBRFSS website.
- Since 2005, questions have been included that randomly select one child in each household and obtain demographic characteristics of that child. This information allows us to ask health-related questions about this child and then to calculate estimates for childhood conditions, such as asthma.
- An Asthma Call-Back survey that follows up on children and adults who were identified as having asthma during the MiBRFS interview has been conducted since 2005, allowing for collection of more detailed information on asthma management, clinical care, and impact of the disease on people’s lives. It is anticipated that this methodology could be useful for other subpopulations in the future.
- In recent years, the MiBRFSS has expanded to include questions focusing on topics such as dental coverage, hookah use, secondhand smoke exposure, inadequate sleep, and prediabetes.
- MiBRFSS estimates are used as progress indicators for federal grants focusing on the prevention and control of diabetes, heart disease, obesity and their associated risk factors (CDC 1422/1305).
- The MiBRFSS is a main source of data for a number of the chronic disease indicators that are used to support Michigan's Coordinated Chronic Disease Prevention and Health Promotion State Plan.
- The MiBRFSS is the source for seven of the 20 indicators included within the Michigan Health and Wellness Dashboard (https://midashboard.michigan.gov/health-and-wellness). This project provides a quick assessment of the health and wellness of Michigan residents.
- Several BRFSS indicators are used in the Robert Wood Johnson County Health Rankings. These rankings measure the overall health of nearly all counties within the United States and rank them within states.

In conclusion, the MiBRFS continues to serve the needs of public health officials, health care providers, researchers and local and state level policy makers, while presenting a number of opportunities for expanding our understanding of the risk factors and preventive behaviors for the major causes of disease and disability in Michigan.
General Health Status

Self-assessed health is a measure of how a person perceives their own health. Self-assessed health status has been validated as a useful indicator of health among different populations and allows for broad comparisons across a variety of health conditions.³

- In 2014, an estimated 16.8% of Michigan adults reported that their general health was either fair or poor.
- Fair or poor general health increased with age and decreased with increasing household income level.
- The prevalence of fair or poor general health was similar by gender and health insurance status.
- White, non-Hispanic adults (15.3%) reported a significantly lower prevalence of fair or poor general health than Black, non-Hispanic (24.3%) and Hispanic adults (24.2%).
- Disabled adults (42.7%) reported a significantly higher prevalence of fair to poor health than non-disabled adults (7.8%).
- The BRFSS methodology changes that were implemented in 2011 resulted in a spike in the prevalence of fair or poor general health among Michigan adults, but since these changes, the prevalence of fair to poor general health has remained within the 16%–17% range.
- In 2014, the prevalence of fair or poor general health among Michigan adults (16.8%) was equal to that of the U.S. median prevalence (16.8%).

<sup>a</sup> Among all adults, the proportion reporting that their health, in general, was either fair or poor.

---

***General Health, Fair or Poor***

**U.S. vs. Michigan, 2005-2014**

Due to methodology changes that took place in 2011, BRFSS estimates from 2011 and moving forward cannot be compared to BRFSS estimates from 2010 and earlier.
Physically and mentally unhealthy days measure the number of days within the past 30 days that individuals rate their physical and mental health as not good. Poor physical and mental health was defined as 14 or more days within the past 30 days in which the adult respondents rated their physical and mental health as not good.

- In 2014, an estimated 12.6% of Michigan adults reported poor physical health and 12.9% reported poor mental health.
- Poor physical health increased with age, while poor mental health decreased with age.
- Both poor physical health and poor mental health decreased with increasing household income level.
- Females (14.7%) reported a higher prevalence of poor mental health than males (11.0%).
- Black, non-Hispanic adults (15.5%) reported a higher prevalence of poor physical health than White, non-Hispanic adults (11.6%).
- Disabled adults (37.7% and 29.3%, respectively) were more likely to have reported both poor physical health and poor mental health than non-disabled adults (4.4% and 7.4%, respectively).
- The BRFSS methodology changes that were implemented in 2011 resulted in a spike in the prevalence of poor physical and mental health among Michigan adults, but these prevalences have plateaued since 2011.

The BRFSS methodology changes that were implemented in 2011 resulted in a spike in the prevalence of poor physical and mental health among Michigan adults, but these prevalences have plateaued since 2011.

- Among all adults, the proportion reporting 14 or more days of poor physical health, which includes physical illness and injury, during the past 30 days.
- Among all adults, the proportion reporting 14 or more days of poor mental health, which includes stress, depression, and problems with emotions, during the past 30 days.

Due to methodology changes that took place in 2011, BRFSS estimates from 2011 and moving forward cannot be compared to BRFSS estimates from 2010 and earlier.
Through the Americans with Disabilities Act, an individual with a disability is defined as a person who has a physical or mental impairment that substantially limits one or more major life activities, a person who has a history of such an impairment, or a person who is perceived by others as having such an impairment.\(^4\)

- In 2014, an estimated 24.9% of Michigan adults reported being disabled, which was defined as being limited in any activities because of physical, mental, or emotional problems or requiring the use of special equipment, such as a cane, a wheelchair, a special bed, or a special telephone due to a health problem.

- When looking at each component of the disability indicator, an estimated 22.5% of Michigan adults reported being limited in their activities, while 10.0% reported that they required the use of special equipment due to a health problem.

- The prevalence of disability increased with age and decreased with increasing household income level.

- The prevalence of disability was similar by gender and race/ethnicity.

- Insured adults (25.8%) were more likely to report having a disability than uninsured adults (18.0%).

\(^4\) Among all adults, the proportion reporting being limited in any activities because of physical, mental, or emotional problems, or reporting that they required the use of special equipment (such as a cane, a wheelchair, a special bed, or a special telephone) due to a health problem.
Overweight and obesity have been proven to increase the risk of many diseases and health conditions such as high blood pressure, diabetes, coronary heart disease, stroke, gallbladder disease, high cholesterol, and some forms of cancer. The medical care costs associated with adult obesity in the United States is projected to be in the $150 billion range. Overweight is defined as having a body mass index (BMI) between 25.0 and 29.9, and obesity is defined as a BMI greater than or equal to 30.0.

- In 2014, an estimated 30.7% of Michigan adults were classified as obese, with an additional 34.9% of Michigan adults being classified as overweight. The prevalence of obesity in Michigan is slightly higher than the U.S. median prevalence (29.6%), while the prevalence of overweight is comparable to that of the U.S. median (35.3%).

- The prevalence of obesity increased through the 65-74 year age group and then dropped within the 75+ years age group.

- The prevalence of obesity was similar by gender and health insurance status.

- In previous years, the prevalence of obesity among Black, non-Hispanic adults was significantly higher than that of White, non-Hispanic adults. In 2014, the prevalence of obesity is similar by race/ethnicity.

- Disabled adults (43.4%) were more likely to be classified as obese than non-disabled adults (26.5%)

- Adults reporting no leisure time physical activity (37.8% [35.1-40.6]) were more likely to report being obese than those who were physically active (28.3% [26.9-29.7]).

- The HP 2020 target for obesity among adults is set at 30.5%. In order to meet this target, the obesity prevalence among Michigan adults will need to decrease by only one tenth of a percentage point during the next six years.

Note: BMI, body mass index, is defined as weight (in kilograms) divided by height (in meters) squared [weight in kg/(height in meters)\(^2\)]. Weight and height were self-reported. Pregnant women were excluded.

- Among all adults, the proportion of respondents whose BMI was greater than or equal to 30.0.

- In 2014, an estimated 30.7% of Michigan adults were classified as obese, with an additional 34.9% of Michigan adults being classified as overweight. The prevalence of obesity in Michigan is slightly higher than the U.S. median prevalence (29.6%), while the prevalence of overweight is comparable to that of the U.S. median (35.3%).

- The prevalence of obesity increased through the 65-74 year age group and then dropped within the 75+ years age group.

- The prevalence of obesity was similar by gender and health insurance status.

- In previous years, the prevalence of obesity among Black, non-Hispanic adults was significantly higher than that of White, non-Hispanic adults. In 2014, the prevalence of obesity is similar by race/ethnicity.

- Disabled adults (43.4%) were more likely to be classified as obese than non-disabled adults (26.5%)

- Adults reporting no leisure time physical activity (37.8% [35.1-40.6]) were more likely to report being obese than those who were physically active (28.3% [26.9-29.7]).

- The HP 2020 target for obesity among adults is set at 30.5%. In order to meet this target, the obesity prevalence among Michigan adults will need to decrease by only one tenth of a percentage point during the next six years.

### U.S. vs. Michigan, 2005-2014

Due to methodology changes that took place in 2011, BRFSS estimates from 2011 and moving forward cannot be compared to BRFSS estimates from 2010 and earlier.
Adults who do not have health care coverage are less likely to access health care services and are more likely to delay getting needed medical attention.iii

- In 2014, an estimated 12.7% of Michigan adults aged 18-64 years reported having no health care coverage. The prevalence of no health care coverage among Michigan adults 18-64 years of age is nearly three percentage points less than the U.S. median prevalence (15.3%).

- The prevalence of no health care coverage decreased with age and increasing household income level.

- Males (15.1%) reported a significantly higher prevalence of no health care coverage than females (10.3%), while Black, non-Hispanic (17.6%) and Hispanic adults (24.5%) reported a higher prevalence than White, non-Hispanic adults (11.3%).

- The prevalence of no health care coverage was similar by disability status.

- The HP 2020 target for health care coverage is to have 100% of adults insured by 2020. Since the prevalence of no health care coverage among Michigan adults 18-64 years of age is currently at 12.7%, this prevalence will need to decrease by more than 2.1 percentage points each year in order to meet the HP 2020 goal.vii

* Among adults aged 18-64 years, the proportion who reported having no health care coverage, including health insurance, prepaid plans such as HMOs, or government plans, such as Medicare or Indian Health Services.
No Dental Care Coverage

For every person without medical insurance, there are nearly three people without dental insurance. Among those without dental coverage, only half of these individuals report having had a dental checkup within the past year.

- In 2014, an estimated 34.3% of Michigan adults reported having no dental care coverage.
- The prevalence of no dental care coverage varied by age, but was lowest among adults 45-64 years of age.
- The prevalence of no dental care coverage decreased with increasing household income level.
- The prevalence of no dental care coverage was similar by gender and race/ethnicity.
- Despite having similar health insurance prevalence estimates, disabled adults (40.7%) were more likely to report not having dental care coverage than non-disabled adults (32.3%).
- Black, non-Hispanic males reported the highest prevalence of no dental care coverage (51.8%).
- The prevalence of no dental care coverage was significantly higher among White, non-Hispanic males (34.8%) than White, non-Hispanic females (25.9%).
- The prevalence of no dental care coverage among White, non-Hispanic and Black, non-Hispanic adults was similar by gender.

* Among all adults, the proportion who reported having no dental care coverage at some point within the past 12 months.
Two additional indicators related to health care access are: 1) not having a personal doctor or health care provider and 2) having had a time during the past 12 months when you needed to see a doctor but could not because of the cost. Increases in access to primary care have been shown to substantially improve health-related outcomes.\textsuperscript{11}

\begin{itemize}
  \item In 2014, an estimated 16.1\% of Michigan adults reported not having a personal health care provider, while 14.6\% reported not seeing the doctor within the past 12 months due to cost.
  \item The prevalences of both of these indicators decreased with age and increasing household income level.
  \item Males (21.4\%) were more likely than females (11.1\%) to not have a personal health care provider.
  \item Both Black, non-Hispanic (22.6\% and 19.1\%, respectively) and Hispanic adults (25.1\% and 29.9\%, respectively) were more likely than White, non-Hispanic adults (14.2\% and 13.0\%, respectively) to not have a personal health care provider and to not have seen a doctor within the past 12 months due to cost.
  \item Uninsured adults (54.6\% and 43.7\%, respectively) were more likely to not have a personal health care provider and to not have seen a doctor within the past 12 months due to cost when compared to insured adults (11.7\% and 11.3\%, respectively).
\end{itemize}

In 2014, an estimated 25.5% of Michigan adults reported no leisure time physical activity within the past month. The prevalence of no leisure time physical activity among Michigan adults is slightly higher than the U.S. median prevalence (22.6%) for this indicator.

The prevalence of no leisure time physical activity increased with age and decreased with increasing household income level.

White, non-Hispanic adults (23.6%) reported a significantly lower prevalence of no leisure time physical activity than Black, non-Hispanic adults (34.3%), while disabled adults (39.3%) reported a higher prevalence than non-disabled adults (20.5%).

The prevalence of no leisure time physical activity was similar by gender.

The HP 2020 target for no leisure time physical activity among adults is set at 32.6%. The prevalence of no leisure time physical activity among Michigan adults is currently more than seven percentage points below this goal, so if Michigan can maintain the current prevalence for this indicator the healthy people target will easily be met by 2020.7

Regular physical activity among adults has been shown to reduce the risk of many diseases including cardiovascular disease, diabetes, colon and breast cancers, and osteoporosis. Keeping physically active also helps to control weight, maintain healthy bones, muscles, and joints, and relieve symptoms of depression.12

Due to methodology changes that took place in 2011, BRFSS estimates from 2011 and moving forward cannot be compared to BRFSS estimates from 2010 and earlier.
Cigarette smoking is the leading cause of preventable death in the United States, accounting for more than 480,000 deaths each year.13

- In 2014, an estimated 21.2% of Michigan adults reported that they currently smoke cigarettes on a regular basis.
- Current smoking decreased with both increasing age and household income level.
- Males (23.7%) reported a higher prevalence of current smoking than females (18.9%), and White, non-Hispanic adults (20.1%) reported a lower prevalence than Hispanic adults (32.4%).
- Disabled adults (26.8%) were more likely to have reported current smoking than non-disabled adults (19.3%).
- Uninsured adults (38.8%) were more likely to have reported current smoking than insured adults (19.3%).
- The HP 2020 target for current smoking among adults is set at 12.0%. In order to meet this target, the current smoking prevalence among Michigan adults will need to decrease by 9.2 percentage points during the next six years.7
- The BRFSS methodology changes that were implemented in 2011 resulted in a spike in the prevalence of current smoking among Michigan adults, but the prevalence of current smoking has declined by two percentage points since 2011.
- In 2014, the prevalence of current smoking among Michigan adults (21.2%) was higher than the U.S. median prevalence (18.1%).

* Among all adults, the proportion reporting that they had ever smoked at least 100 cigarettes (5 packs) in their life and that they smoke cigarettes now, either every day or on some days.
Hookah (water pipe) use has become a popular tobacco smoking method within the United States, with increasing popularity among the college student population. Hookah use should not be considered as a safe alternative to smoking cigarettes. The charcoal used to heat the tobacco and the smoke generated from hookahs contain many toxic agents that are known to cause lung, bladder, and oral cancers.14

- In 2014, an estimated 4.1% of Michigan adults reported that they smoked tobacco using a hookah on one or more days out of the previous month.
- Current hookah use was highest among the 18-24 year old age group (12.0%).
- Males (5.5%) were more likely to report current hookah use than females (2.9%).
- Current hookah use decreased with increasing household income level.
- Current hookah use was similar by health insurance and disability status.
- White, non-Hispanic males (4.7%) reported a significantly higher prevalence of current hookah use than White, non-Hispanic females (2.1%).
- The prevalence of current hookah use among Black, non-Hispanic adults was similar by gender.

Among all adults, the proportion reporting smoking tobacco using a hookah, narghile, or water pipe on one or more days during the previous thirty days. Suppressed due to a denominator of < 50 and/or a relative standard error > 30%.
Among adults who have never smoked, secondhand smoke exposure causes an estimated 34,000 heart disease deaths and 7,300 lung cancer deaths within the United States each year.\textsuperscript{13}

- In 2014, an estimated 24.9% of Michigan adults reported that they were exposed to secondhand smoke in their home or car within the past seven days.

- 11.5% (95% CI: 9.2-14.3) of Michigan adults with children living in their households reported being exposed to secondhand smoke in their home within the past seven days.

- Secondhand smoke exposure decreased with both increasing age and household income level.

- Secondhand smoke exposure was similar by gender.

- Black, non-Hispanic (36.8%) and Hispanic adults (36.7%) reported a significantly higher prevalence of secondhand smoke exposure than White, non-Hispanic adults (22.3%).

- Uninsured and disabled adults (44.3% and 30.1%, respectively) were more likely to have reported recent secondhand smoke exposure than insured and non-disabled adults (22.9% and 23.3%, respectively).

- White, non-Hispanic females reported the lowest prevalence of recent secondhand smoke exposure at 19.0%. White, non-Hispanic males and females (25.9% and 19.0%, respectively) reported lower prevalences of recent secondhand smoke exposure than Black, non-Hispanic males (40.7%).

* Among all adults, the proportion reporting being exposed to secondhand smoke in their home or a car within the past seven days.
Excessive alcohol use contributes to approximately 88,000 deaths each year within the United States. Binge drinking is defined as consuming five or more alcoholic drinks per occasion (for men) or four or more alcoholic drinks per occasion (for women) at least once in the past month. Heavy drinking is defined as consuming an average of more than two alcoholic drinks per day for men or more than one alcoholic drink per day for women in the past month.

In 2014, an estimated 57.0% (95% CI: 55.6-58.3) of Michigan adults reported some form of alcohol consumption within the past month. Furthermore, an estimated 18.9% of Michigan adults reported binge drinking on at least one occasion within the past month, and 6.8% (95% CI: 6.1-7.6) reported heavy drinking over the past month.

Both binge drinking and heavy drinking are more prevalent within the younger age groups and decrease significantly within the older age groups.

Males (24.0%) reported a significantly higher prevalence of binge drinking than females (14.3%).

Black, non-Hispanic adults (12.8%) reported a significantly lower prevalence of binge drinking than White, non-Hispanic adults (19.6%).

Disabled adults (12.8%) reported a significantly lower prevalence of binge drinking than non-disabled adults (21.1%).

The prevalence of binge drinking among Michigan adults has decreased slightly since the BRFSS methodology changes in 2011, but remains higher than the U.S. median prevalence.

**Binge Drinking**

**U.S. vs. Michigan, 2005-2014**

Due to methodology changes that took place in 2011, BRFSS estimates from 2011 and moving forward cannot be compared to BRFSS estimates from 2010 and earlier.
Motor Vehicle Safety

Seatbelt use has been proven to save lives and prevent injuries. In 2013, 21,132 people died in the United States in motor vehicle traffic crashes, of which only 46% were restrained. In 2013, seat belts saved an estimated 12,584 lives among motor vehicle occupants 5 years of age and older within the United States. In addition to seatbelt use, driving after drinking is another risk indicator for motor vehicle safety. In Michigan, 3.1% of all crashes were reported to involve drinking in 2014. During this same time period, three out of every 10 fatal motor vehicle crashes involved drinking. Consumption of alcohol is a major factor in the more serious types of motor vehicle crashes.

- In 2014, an estimated 87.7% of Michigan adults reported always using their seat belt when driving or riding in a car, while only 2.2% of Michigan adults reported driving after drinking within the past month.
- Seatbelt use increased slightly with age, while driving after drinking decreased within the older age groups.
- Males reported a significantly lower prevalence of seatbelt use (84.1% vs. 91.1%) and a significantly higher prevalence of driving after drinking (3.4% vs. 1.1%) compared to females.
- Adults with health insurance (88.6%) were more likely than uninsured adults (80.0%) to always wear their seatbelt.

Due to methodology changes that took place in 2011, BRFSS estimates from 2011 and moving forward cannot be compared to BRFSS estimates from 2010 and earlier.
Inadequate sleep is a serious public health problem that has been linked to motor vehicle crashes, industrial disasters, and chronic conditions such as diabetes, cardiovascular disease, obesity, and depression. In 2014, an estimated 40.2% of Michigan adults reported getting less than an adequate amount of sleep on an average night. Inadequate sleep was defined as less than eight hours per night for adults aged 18-21 years, and less than seven hours for adults aged 22 years and older.

The prevalence of inadequate sleep decreased with increasing age and household income level.

Males (42.4%) reported a significantly higher prevalence of inadequate sleep than females (38.1%).

Black, non-Hispanic (51.2%) and Hispanic adults (50.1%) reported a significantly higher prevalence of inadequate sleep than White, non-Hispanic adults (37.4%).

Uninsured and disabled adults (49.8% and 48.0%, respectively) were more likely to have reported inadequate sleep than insured and non-disabled adults (39.1% and 37.6%, respectively).

White, non-Hispanic males (39.9%) reported a higher prevalence of inadequate sleep than White, non-Hispanic females (35.1%).

Black, non-Hispanic adults reported the highest prevalence of inadequate sleep (51.2%), but the prevalence among Black, non-Hispanic adults was similar by gender.

Among adults aged 18-21 years, the proportion reporting an average sleep time of less than eight hours per night, and among adults aged 22 years and older, the proportion reporting an average sleep time of less than seven hours per night.
A yearly routine checkup is a great way to remain proactive about one’s health. The benefits of having an annual checkup include early diagnosis and treatment of existing conditions and prevention of future medical problems. In 2014, an estimated 71.8% of Michigan adults reported having a routine medical checkup within the past year. The prevalence of having a routine checkup within the past year increased with age. Males (66.6%) reported a significantly lower prevalence of having a routine checkup within the past year than females (76.6%). White, non-Hispanic adults (70.4%) reported a significantly lower prevalence of having had a routine checkup within the past year than did Black, non-Hispanic adults (80.4%). Insured and disabled adults (75.5% and 77.0%, respectively) were more likely to have had a routine checkup within the past year than uninsured and non-disabled adults (39.3% and 70.0%, respectively). Michigan adults who had a routine checkup within the past year were more likely to have had diabetes testing within the past three years [64.1% vs. 38.7%], a flu vaccine within the past year (65+ years) [59.7% vs. 43.1%, and to have ever had a pneumonia vaccine (65+ years) [71.6% vs. 54.5%] when compared to adults who had not had a routine checkup within the past year.

Due to methodology changes that took place in 2011, BRFSS estimates from 2011 and moving forward cannot be compared to BRFSS estimates from 2010 and earlier.
Breast Cancer Screening

Breast cancer is currently the second leading cause of cancer deaths among women within the United States. In 2012, there were 1,424 deaths among Michigan women due to breast cancer, second only to that of lung cancer. Early detection of breast cancer can occur through the use of screening tools such as mammography and clinical breast exams.

In 2014, an estimated 75.9% of Michigan women 40 years and older reported having a mammogram within the past two years, while 47.8% reported having both a clinical breast exam and a mammogram within the past year.

Breast cancer screening measures increased with household income level, but were similar by race/ethnicity.

Insured adults (77.8%) were more likely than uninsured adults (43.6%) to have reported receiving a mammogram within the past two years.

The HP 2020 target for having received a mammogram within the past two years among women aged 40 years and older is set at 81.1%. The prevalence for this indicator among Michigan women 40 years and older (75.9%) will need to increase by 5.2 percentage points during the next six years in order to meet the HP 2020 target.

The prevalence of having had a mammogram within the past two years among Michigan women 40 years and older is slightly higher than the U.S. median prevalence for this indicator.

Had a Mammogram in the Past Two Years Among Women Aged 40 Years and Older
U.S. vs. Michigan, 2002-2014

Due to methodology changes that took place in 2011, BRFSS estimates from 2011 and moving forward cannot be compared to BRFSS estimates from 2010 and earlier.
Current guidelines for cervical cancer screening recommend that women 21 to 65 years of age receive a Pap test at least every three years. Women 30 to 65 years of age can also choose to lengthen their testing interval by having a Pap test and HPV testing combined every five years.\(^\text{22}\)

- In 2014, an estimated 88.9% of Michigan women aged 18 years and older reported ever having a Pap test, while 74.9% reported having had a Pap test within the past three years.

- The prevalence of appropriate cervical cancer screening increased with age until falling off in the oldest age group.

- The prevalence of appropriate cervical cancer screening was similar by race/ethnicity, but increased with household income level.

- Insured women (77.2%) were more likely to report appropriate cervical cancer screening than uninsured women (55.8%).

- The HP 2020 target for the proportion of women aged 18 years and older who have received a Pap test within the past three years is set at 93.0%.\(^\text{7}\) The prevalence of this indicator among Michigan women aged 18 years and older will need to increase by an average of three percentage points per year in order to meet the HP 2020 target.

- Over the past several years, the prevalence of appropriate cervical cancer screening among women 18 years and older has been on the decline in Michigan and the U.S. This decrease persists when looking only at Michigan women 18-65 years of age (2012: 82.3% and 2014: 77.8%).

**Had a Pap Test in the Past Three Years Among Women Aged 18 Years and Older**

**U.S. vs. Michigan, 2002-2014**

Due to methodology changes that took place in 2011, BRFSS estimates from 2011 and moving forward cannot be compared to BRFSS estimates from 2010 and earlier.
Prostate cancer is the second leading cause of cancer deaths among males in Michigan; there were 894 deaths in 2012 (19.1 deaths per 100,000 male population, age adjusted).²¹

- In 2014, an estimated 73.4% of Michigan men aged 50 years and older reported discussing the advantages of a Prostate-Specific Antigen (PSA) test with their doctor, while 45.8% reported having had a PSA test within the past year.
- The prevalence of having had a PSA test within the past year increased with age and household income level.
- The prevalence of having a PSA test within the past year was similar by race/ethnicity and disability status.
- Prior to the 2011 BRFSS methodology changes, the prevalence of receiving a PSA test within the past year among Michigan men 50 years and older was stable over time. The BRFSS methodology changes caused the PSA testing prevalence to take a significant decline in 2012. The 2014 MiBRFS PSA testing prevalence is similar to that of the 2012 prevalence.

* Among adults aged 50 years and older, the proportion reporting having a fecal occult blood test within the past year, a sigmoidoscopy within the past five years, or a colonoscopy within the past ten years.

Due to methodology changes that took place in 2011, BRFSS estimates from 2011 and moving forward cannot be compared to BRFSS estimates from 2010 and earlier.
Oral Health

Oral health is an important part of one’s general health and quality of life. Regular dental care includes preventive dental services such as teeth cleaning, and permits early diagnosis and treatment of tooth decay and periodontal diseases. It has been estimated that low income adults are 2.5 times more likely to have at least one untreated decayed tooth compared with higher income adults (40% vs. 16%).

- In 2014, an estimated 31.4% of Michigan adults reported not having had a dental visit within the past year.
- With exception of the 25-34 years age group, the prevalence of not having had a dental visit within the past year was similar by age.
- The prevalence of not having had a dental visit within the past year decreased with increasing household income.
- Males (35.5%) were more likely to have reported not having a dental visit within the past year compared to females (27.5%).
- Black, non-Hispanic adults (45.1%) reported a higher prevalence of no dental visit within the past year than White, non-Hispanic adults (28.6%).
- Uninsured adults and disabled adults (60.1% and 40.4%, respectively) were more likely to have not had a dental visit within the past year compared to insured adults and non-disabled adults (28.2% and 28.2%, respectively).
- The prevalence of having six or more teeth missing was greater among Black, non-Hispanics (23.4%) than White, non-Hispanics (14.5%).

Immunizations Among Adults 65 Years of Age and Older

Adult immunizations against influenza and pneumococcal disease are important health indicators that need to be routinely monitored since morbidity and mortality are associated with both of these diseases within different demographic groups.  

- In 2014, an estimated 57.6% of Michigan adults ages 65 years and older reported receiving a flu vaccine within the past year, while an estimated 69.3% of this population reported ever receiving a pneumonia vaccine.

- Females aged 65 years and above (72.3%) reported a significantly higher prevalence of ever having a pneumonia vaccine than males aged 65 years and above (65.5%).

- White, non-Hispanic adults were more likely than Black, non-Hispanic adults to have received a flu vaccine within the past year (59.4% vs. 47.5%) and a pneumonia vaccine ever (71.3% vs. 57.1%).

- Disabled adults (76.8%) were more likely to have ever received a pneumonia vaccine than non-disabled adults (64.6%).

- The prevalence of ever having had a pneumonia vaccine among Michigan adults 65 years and older has remained relatively stable over the past four years.

\textsuperscript{a} Among adults aged 65 years and older, the proportion reporting that they had a flu vaccine, either by injection in the arm or sprayed in the nose during the past 12 months.

\textsuperscript{b} Among adults aged 65 years and older, the proportion reporting that they ever had a pneumococcal vaccine.

\textsuperscript{c} Suppressed due to a denominator < 50 and/or a relative standard error > 30%.

Due to methodology changes that took place in 2011, BRFSS estimates from 2011 and moving forward cannot be compared to BRFSS estimates from 2010 and earlier.
HIV Testing

Early awareness of an HIV infection through HIV testing can prevent further spread of the disease, and an early start on antiretroviral therapy can increase the quality of life among those who are living with HIV/AIDS.20

- In 2014, an estimated 40.2% of Michigan adults reported ever being tested for HIV.
- Females (44.8%) reported a significantly higher prevalence of HIV testing than males (35.6%).
- Black, non-Hispanic adults (70.5%) reported a significantly higher prevalence of HIV testing than both White, non-Hispanic (34.0%) and Hispanic adults (53.7%).
- The prevalence of HIV testing decreased with increasing household income level.
- Disabled adults (46.5%) were more likely to have been tested for HIV than non-disabled adults (38.5%).
- Since the BRFSS methodology changes that were implemented in 2011, the prevalence of HIV testing among Michigan adults has remained stable over time.

* Among adults aged 18-64 years, the proportion reporting that they ever had been tested for HIV, apart from tests that were part of a blood donation.

Due to methodology changes that took place in 2011, BRFSS estimates from 2011 and moving forward cannot be compared to BRFSS estimates from 2010 and earlier.
Asthma in Adults

Asthma is a chronic inflammatory disorder of the lungs, characterized by wheezing, coughing, difficulty breathing, and chest tightness. Allergies, a family history of asthma or allergy, low birth weight, and exposure to tobacco smoke are just a few of the potential risk factors that are associated with the development of asthma.27

♦ In 2014, an estimated 15.3% of Michigan adults reported that they were ever diagnosed with asthma and 10.9% reported that they currently have asthma.

♦ The prevalence of both lifetime and current asthma decreased with age and increasing household income level.

♦ Females reported a significantly higher prevalence than males for both lifetime (17.6% vs. 13.0%) and current asthma (13.5% and 8.1%).

♦ Black, non-Hispanic adults (14.2%) reported a significantly higher prevalence of current asthma than White, non-Hispanic adults (10.1%).

♦ Disabled adults reported a significantly higher prevalence than non-disabled adults for both lifetime (23.4% vs. 12.5%) and current asthma (17.7% vs. 8.5%).

♦ In 2014, the prevalence of ever being diagnosed with asthma among Michigan adults (15.3%) was higher than the U.S. median prevalence (13.8%).

Lifetime Adult Asthma
U.S. vs. Michigan, 2005-2014

Due to methodology changes that took place in 2011, BRFSS estimates from 2011 and moving forward cannot be compared to BRFSS estimates from 2010 and earlier.
Although asthma can affect people of all ages, in most cases it begins during childhood. More than 22 million people in the United States are known to have asthma, and about six million of these people are children. Children with a family history of asthma and allergy are at a higher risk of developing asthma during childhood.²⁸

- Based on proxy information provided by the adult respondent, the estimated proportion of Michigan children aged 0-17 years who were ever told by a doctor that they had asthma for 2014 was 14.2%, and an estimated 10.2% currently have asthma.

- The prevalences of both lifetime and current asthma increased with age until 10-14 years of age and then dropped slightly within the 15-17 year-old age group.

- The prevalence of both lifetime and current asthma among children decreased with increasing household income level.

- White, non-Hispanic children (12.5% and 8.9%, respectively) were less likely to report both lifetime and current asthma than Black, non-Hispanic children (22.7% and 19.3%, respectively).

- Black, non-Hispanic children were more likely to report lifetime asthma than White, non-Hispanic children, but the prevalence was similar by gender within each racial/ethnic group.

²⁸ Estimated proportion of Michigan children aged 0-17 years ever told by a doctor, nurse, or other health care professional that they had asthma, using proxy information from the adult respondent.
²⁹ Estimated proportion of Michigan children aged 0-17 years who still have asthma, using proxy information from the adult respondent.
³ Suppressed due to a denominator < 50 and/or a relative standard error > 30%.

Due to methodology changes that took place in 2011, BRFSS estimates from 2011 and moving forward cannot be compared to BRFSS estimates from 2010 and earlier.
Chronic obstructive pulmonary disease (COPD) is a progressive disease that usually results in coughing, wheezing, shortness of breath, chest tightness, and other symptoms. Cigarette smoking is the leading cause of COPD.29

- In 2014, an estimated 8.8% of Michigan adults reported ever being told by a doctor that they had COPD.
- The prevalence of COPD increased with age and decreased with increasing household income level.
- Females (10.0%) reported a significantly higher prevalence of COPD than males (7.6%).
- Black, non-Hispanic adults (11.5%) reported a significantly higher prevalence of COPD than White, non-Hispanic adults (8.3%) \( p = 0.031 \).
- Disabled adults (20.5%) were more likely to have been diagnosed with COPD than non-disabled adults (4.9%).
- Current smokers (16.1% [13.8-18.6]) reported a significantly higher lifetime prevalence of COPD than their non-smoking counterparts (6.8% [6.1-7.5]).
- The prevalence of COPD was similar by gender for both White, non-Hispanic and Black, non-Hispanic adults.
- In 2014, the prevalence of COPD among Michigan adults (8.8%) was higher than the U.S. median prevalence (6.5%).

Due to methodology changes that took place in 2011, BRFSS estimates from 2011 and moving forward cannot be compared to BRFSS estimates from 2010 and earlier.
Arthritis and rheumatism are the leading causes of disability within the United States. These conditions have been diagnosed in an estimated 52.5 million U.S. adults. In 2014, an estimated 31.9% of Michigan adults reported ever being told by a doctor that they had some form of arthritis, rheumatoid arthritis, gout, lupus, or fibromyalgia. Females (35.5%) reported a significantly higher prevalence of arthritis than males (28.1%). The prevalence of arthritis was similar by race/ethnicity. The prevalence of arthritis increased with age and decreased with increasing household income level. Uninsured adults (19.0%) were less likely to have been diagnosed with arthritis than insured adults (33.5%), while disabled adults (63.1%) were more likely to have been diagnosed than non-disabled adults (21.5%). In 2014, the prevalence of arthritis among Michigan adults (31.9%) was significantly higher than the U.S. median prevalence (26.0%).

*Among all adults, the proportion reporting ever being told by a doctor that they had some form of arthritis, rheumatoid arthritis, gout, lupus, or fibromyalgia.

Due to methodology changes that took place in 2011, BRFSS estimates from 2011 and moving forward cannot be compared to BRFSS estimates from 2010 and earlier.
Heart disease and stroke are the first and fourth leading causes of death, respectively, in both Michigan and the United States. In 2014, an estimated 5.2% of Michigan adults had ever been told by a doctor that they had a heart attack, 5.4% had ever been told they had angina or coronary heart disease, and 3.3% had ever been told they had a stroke.

When combining all three measures into one indicator, an estimated 10.0% of Michigan adults have ever been told by a doctor that they had a heart attack, angina or coronary heart disease, or stroke.

The prevalences of all three diseases increased with age and decreased with increasing household income level.

Males reported higher prevalences than females for heart attack and coronary heart disease, but not stroke.

The prevalences of all three diseases were similar by race/ethnicity.

Disabled adults were more likely to have been diagnosed with each of the three diseases when compared to non-disabled adults.

In 2014, the prevalence of heart attack (5.2%), coronary heart disease (5.4%), and stroke (3.3%) among Michigan adults were all comparable to the U.S. median prevalence (heart attack: 4.4%; coronary heart disease: 4.2%; and stroke: 3.0%).

- Uninsured: 3.1 (1.9-5.1) -- -- 2.5 (1.3-4.5)

### Disability
- Not disabled: 3.1 (2.7-3.6) 3.1 (2.7-3.6) 1.4 (1.1-1.8)
- Disabled: 11.4 (10.0-13.1) 12.2 (10.7-13.9) 8.4 (7.1-9.9)

---

Among all adults, the proportion ever told by a doctor that: * they had a heart attack or myocardial infarction, † they had angina or coronary heart disease, or ‡ they had a stroke.

* Suppressed due to a denominator < 50 and/or a relative standard error > 30%.

---

**Cardiovascular Disease by Gender Michigan, 2014**

Due to methodology changes that took place in 2011, BRFSS estimates from 2011 and moving forward cannot be compared to BRFSS estimates from 2010 and earlier.
Cancer is the second leading cause of death in both Michigan and the United States. There are more than 100 different types of cancer and it is estimated that there will be nearly 1.7 million new cases of cancer within the following year.

- In 2014, an estimated 5.8% of Michigan adults had ever been told by a doctor that they had skin cancer, and 7.7% reported ever being diagnosed with a type of cancer other than skin cancer.
- When combining these two measures into one indicator, an estimated 12.3% of Michigan adults had ever been told by a doctor that they had some form of cancer. The prevalence of cancer increased with age, but was similar by gender.
- White, non-Hispanic adults (13.9%) reported a significantly higher prevalence of cancer than Black, non-Hispanic (6.4%).
- Insured adults and disabled adults reported higher cancer prevalences than uninsured and non-disabled adults, respectively.
- In 2014, the prevalence for skin cancer (5.8%) and other types of cancer (7.7%) were comparable to the U.S. median prevalence (skin cancer, 6.1% and other cancers, 6.8%).

Due to methodology changes that took place in 2011, BRFSS estimates from 2011 and moving forward cannot be compared to BRFSS estimates from 2010 and earlier.

Prediabetes is an underreported condition that increases a person’s risk of type 2 diabetes, heart disease and stroke. In 2014, an estimated 8.2% of Michigan adults reported ever being told by a doctor that they had prediabetes. The prevalence of prediabetes increased with age, but was similar by gender and insurance status. Black, non-Hispanic adults (12.3%) reported a significantly higher prevalence of prediabetes than White, non-Hispanic adults (7.3%). Adults within the highest household income category reported the lowest prevalence of prediabetes (6.9%). Disabled adults (13.7%) were more likely to report having ever been told they had prediabetes compared to non-disabled adults (6.6%). White, non-Hispanic males (7.1%) reported a significantly lower prevalence of prediabetes than Black, non-Hispanic males (11.9%) \( [p = 0.049] \), and White, non-Hispanic females (7.6%) reported a significantly lower prevalence of prediabetes than Black, non-Hispanic females (12.6%) \( [p = 0.014] \).

Prediabetes by Race and Gender
Michigan, 2014

Due to methodology changes that took place in 2011, BRFSS estimates from 2011 and moving forward cannot be compared to BRFSS estimates from 2010 and earlier.
In 2013, diabetes was the seventh leading cause of death in both Michigan and the United States.\textsuperscript{31} Obesity, poor diet, physical inactivity, and high blood pressure are just a few of the known risk factors that are associated with the development of diabetes.\textsuperscript{29}

- In 2014, an estimated 10.4% of Michigan adults reported ever being told by a doctor that they had diabetes.
- The prevalence of diabetes increased with age and decreased with increasing household income level.
- The prevalence of diabetes was similar by gender, but Black, non-Hispanic adults (13.8%) reported a significantly higher prevalence of diabetes than White, non-Hispanic adults (9.9%).
- Uninsured adults (3.5%) were less likely to have been diagnosed with diabetes than insured adults (11.2%), while disabled adults (20.2%) were more likely to have been diagnosed than non-disabled adults (7.1%).
- Obese (18.9% [17.2-20.7]) and overweight (9.2% [8.1-10.4]) adults reported significantly higher lifetime prevalences of diabetes than healthy weight adults (3.7% [3.0-4.6]).
- Prior to the BRFSS methodology changes that were implemented in 2011, the prevalence of diabetes among Michigan adults was increasing slightly over time. This trend seems to have stabilized a bit since 2011.
- In 2014, the prevalence of diabetes among Michigan adults (10.4%) was comparable to the U.S. median prevalence (10.0%).

Kidney disease is a condition in which the kidneys are damaged and cannot filter blood properly. Adults with diabetes or hypertension are at increased risk of kidney disease. Kidney disease is also a risk factor for the development of cardiovascular disease.

- In 2014, an estimated 3.3% of Michigan adults reported ever being told by a doctor that they had kidney disease.
- The prevalence of kidney disease increased with age and decreased with increasing household income level.
- The prevalence of kidney disease was similar by gender and race/ethnicity.
- Disabled adults (8.8%) were more likely to have been diagnosed with kidney disease than their non-disabled counterparts (1.5%).
- Michigan adults with diabetes (10.2% [95% CI: 8.2-12.6]) were over four times as likely to have been diagnosed with kidney disease than adults without diabetes (2.5% [95% CI: 2.1-3.0]).
- White, non-Hispanic females (3.9%) reported a higher prevalence of kidney disease than White, non-Hispanic males (2.5%).
- In 2014, the prevalence of kidney disease among Michigan adults (3.3%) was similar to the U.S. median prevalence (2.7%).

* Among all adults, the proportion reporting ever being told by a doctor that they had kidney disease.

b Suppressed due to a denominator < 50 and/or a relative standard error > 30%.

In 2014, an estimated 3.3% of Michigan adults reported ever being told by a doctor that they had kidney disease. The prevalence of kidney disease increased with age and decreased with increasing household income level. The prevalence of kidney disease was similar by gender and race/ethnicity. Disabled adults (8.8%) were more likely to have been diagnosed with kidney disease than their non-disabled counterparts (1.5%). Michigan adults with diabetes (10.2% [95% CI: 8.2-12.6]) were over four times as likely to have been diagnosed with kidney disease than adults without diabetes (2.5% [95% CI: 2.1-3.0]). White, non-Hispanic females (3.9%) reported a higher prevalence of kidney disease than White, non-Hispanic males (2.5%). In 2014, the prevalence of kidney disease among Michigan adults (3.3%) was similar to the U.S. median prevalence (2.7%).
Depression is a common and treatable medical disorder that is more common among individuals with chronic conditions such as obesity, diabetes, and arthritis. In 2014, an estimated 20.5% of Michigan adults reported ever being told by a doctor that they had a depressive disorder including depression, major depression, dysthymia, or minor depression.

- The prevalence of depression was highest in the middle age groups and decreased with increasing household income level.
- Females (24.7%) reported a significantly higher prevalence of depression than males (15.9%).
- The prevalence of depression was similar by race/ethnicity and insurance status.
- Disabled adults (42.6%) were more likely to have been diagnosed with depression than non-disabled adults (13.3%).
- White, non-Hispanic females (25.2%) reported a significantly higher prevalence of depression than White, non-Hispanic males (16.4%).
- In 2014, the prevalence of depression among Michigan adults (20.5%) was higher than the U.S. median prevalence (18.9%).

Data was collected for the 2014 Michigan Behavioral Risk Factor Survey (MiBRFS) by the Institute for Public Policy and Social Research, Office for Survey Research, at Michigan State University. The authors are grateful to Linda Stork, Debra Rusz, and the many BRFSS supervisors and interviewers for conducting the survey.

The assistance and financial support provided by the Population Health Surveillance Branch of the Centers for Disease Control and Prevention and our many MDHHS program partners is greatly appreciated.

We are especially grateful to the residents of Michigan who agreed to participate in this survey.
