detailed comment methodology & Field recon

SECNO	DESCRIPTION
24248	VALLEY SECTION A - THIS SECTION IS THE FINAL SECTION ON THE HARRINGTON DRAIN, CLINTON TOWNSHIP STUDY (J&A JOB NO. 5670-02) STARTING WATER SURFACES WERE TAKEN FROM THAT STUDY. ENCROACHMENT AT BRICK WALL IN LEFT OVERBANK (STATION 326)
24398	REPEAT OF PREVIOUS SECTION - NO INVERT ADJUSTMENT REQUIRED THIS SECTION WAS PLACED AT SOUTH END OF BRICK WALL. ENCROACHED SAME AS PREVIOUS SECTION.
25008	VALLEY SECTION B ENCROACHMENT IN LEFT OVERBANK AT EDGE OF RO. OF HOUSES (STATION 190). ENCROACHMENT WAS THEN MOVED IN TO STATION 300 TO RAISE WATER SURFACE LESS THAN .1FT.
25388	THIS SECTION IS A DUPLICATE OF VALLEY SECTION C. THIS SECTION WAS PLACED HERE TO ENCROACH THE HOUSES FROM THE FLOODWAY IN THE LEFT OVERBANK (STATION 150) INVERT WAS ADJUSTED TO FOLLOW CHANNEL SLOPE. ENCROACHMENT PLACED AT STATION 350 ON ENCROACHED RUN TO RAISE WATER SURFACE LESS THAN .1FT.
25838	VALLEY SECTION C
25861	DOWNSTREAM FACE OF BRIDGE SECTION D ENCROACHED AT CENTER LINE OF GARFIELD ROAD (STATION 100) AND ENCROACHED TO END OF VALLEY SECTION C (STATION 500)
25935	UPSTREAM FACE OF BRIDGE SECTION D ENCROACHED SAME AS DOWNSTREAM FACE. BRIDGE TABLE ENCROACHED AT STATIONS 100 AND 500
25955	DUPLICATE OF VALLEY SECTION C
26198	VALLEY SECTION E
26300	DOWNSTREAM FACE OF BRIDGE SECTION F. CROSS SECTION IS SKEWED 45 DEGREES TO FLOW. SKEW FACTOR OF .707 INPUT TO CORRECT GR STATIONS FOR NON-PERPENDICULARITY SECTION CUT OFF AT STATION 200 BECAUSE OF CONSTRICTION UPSTREAM. ENCROACHMENT COULD NOT BE USED BECAUSE OF SKEW FACTOR INPUT
26355	UPSTREAM FACE OF BRIDGE SECTION F. SKEW FACTOR OF .707 INPUT TO CORRECT BT STATIONS SECTION CUT OFF SAME AS DOWNSTREAM FACE OF BRIDGE. BRIDGE TABLE IS ENCROACHED AT STATION 200
26455	DUPLICATE OF VALLEY SECTION E ENCROACHMENT IN LEFT AND RIGHT OVERBANKS AT EDGES OF HOUSES (STATIONS 95 AND 155)
26605	REPEAT OF PREVIOUS SECTION. THIS SECTION PLACED HERE TO ENCROACH HOUSES FROM FLOODWAY SIMILAR TO PREVIOUS SECTION
27278	VALLEY SECTION G - ENCROACHMENT PLACED AT STATION 200 ON ENCROACHED RUN TO RAISE WATER SURFACE LESS THAN .1FT.

Harrington Drain
City of Fraser

28378	VALLEY SECTION H ENCROACHMENTS LEFT AND RIGHT AT EDGES OF BUILDINGS THE RESULTING TOPWIDTH ALSO CORRESPONDS WITH THE TOPWIDTH REQUIRED FOR A 4:1 EXPANSION OF FLOW THROUGH UTICA ROAD BRIDGE
28449	DOWNSTREAM FACE OF BRIDGE SECTION I
28487	UPSTREAM FACE OF BRIDGE SECTION I
28538	DUPLICATE OF VALLEY SECTION H ENCROACHED FOR 1:1 CONTRACTION OF FLOW THROUGH BRIDGE
28848	DUPLICATE OF VALLEY SECTION K (30068) WITH INVERT ADJUSTED TO FOLLOW CHANNEL SLOPE. SECTION WAS USED TO MODEL EXPANSION OF FLOW INTO RIGHT OVERBANK AND THEN CONTRACTING INTO UTICA ROAD BRIDGE
29538	VALLEY SECTION J ENCROACHED AT EDGE OF HOUSES IN RIGHT OVERBANK (STATION 460)
29778	REPEAT OF PREVIOUS SECTION WITH INVERT ADJUSTED THIS SECTION PLACED HERE TO CUT OFF FLOODWAY AT EDGE OF HOUSES (STATION 460)
30068	VALLEY SECTION K
30838	VALLEY SECTION L ENCROACHED TO MODEL THE 4:1 EXPANSION OF FLOW THROUGH BRIDGE (STATIONS 180 AND 360)
31157	DOWNSTREAM FACE OF BRIDGE SECTION M
31199	UPSTREAM FACE OF BRIDGE SECTION M
31360	DUPLICATE OF VALLEY SECTION L
31948	VALLEY SECTION N
32548	VALLEY SECTION O - ENCROACHED AT STATION 100 TO MODEL 4:1 EXPANSION FROM UPSTREAM CONSTRICTION. ENCROACHMENTS MOVED IN TO STATIONS 150 AND 300 ON ENCROACHED RUN TO RAISE WATER SURFACE LESS THAN .1FT.
33058	VALLEY SECTION P ENCROACHED LEFT AND RIGHT AT EDGE OF HOUSES (STATIONS 90 AND 200)
33369	DUPLICATE OF VALLEY SECTION Q. NO ADJUSTMENT TO INVERT REQUIRED. SECTION IS ENCROACHED IN LEFT AND RIGHT OVERBANKS (STATIONS 120 @ 230) AT EDGE OF HOUSES.
33418	VALLEY SECTION Q ENCROACHED LEFT AND RIGHT AT EDGE OF HOUSES (STATIONS 120 AND 230)
33538	THIS SECTION REPRESENTS THE GROUND PROFILE BETWEEN THE HOUSES ALONG CAMBRIDGE DRIVE AND WAS USED AS THE WEIR IN THE CALCULATIONS FOR BRIDGE SECTION R. THE SECTION IS ENCROACHED AT STATION 267 BECAUSE OF THE HIGH GROUND IN THE RIGHT OVERBANK AT VALLEY SECTION S
33558	THIS SECTION IS IDENTICAL TO SECTION 33538
33620	THIS IS A VALLEY SECTION 1FT. UPSTREAM FROM THE INLET TO THE CAMBRIDGE DRIVE DRAIN ENCLOSURE.
33698	VALLEY SECTION S
33978	VALLEY SECTION T
34248	VALLEY SECTION U

Limited Map Maintenance Program
Hydraulic Background Information

This study covers the Clinton River, starting from its confluence with the North Branch of the Clinton River to the upstream Corporate Limit. The study was performed to check on the present validity of the discharges used in the existing FIS for the indicated reach of river. This study was limited to only the 100- and 500-year floods. Also the hydraulic model was modified to account for a bridge replacement at Garfield Road and to make a new encroached run. At the time of the original study, the HEC-2 encroachment option was not available. It was felt that the full extent of allowable encroachment had not been determined.

As part of this study a field survey was made in the fall of 1989. The survey only included the river channel and Garfield Road. The MDNR also supplied a hard copy of the original FIS HEC-2 input data. A comparison plot was made for the channel sections of the FIS HEC-2 data and that obtained in the new survey. The differences were minor, so it was decided to use the original FIS HEC-2 input except for recoding the Garfield Road Bridge. Initially the FIS HEC-2 data was typed into the computer and a run was executed to check for typographical mistakes and consistency of results. In the original data a mistake was found on a NC card with a channel and overbank "n" value being transposed; the mistake was corrected. Even with this change the output matched the original study for both profiles within 0.11 foot. The largest difference occurred at the section with the transposed "n" values.

The coding on the existing FIS HEC-2 data was then modified to include the new 100- and 500-year discharges (as approved by the hydrology section of the MDNR) and the replaced bridge at Garfield Road. The new bridge is slightly upstream of the original bridge, resulting in a slight change in the bridge stationing. Also, the left overbank had an encroachment due to structures, but did not restrict the weir flow. In the current model, the weir flow is being restricted beyond the encroachment. The only other changes were minor adjustments to several encroachments. The starting conditions were obtained at the initial cross section from the existing FIS. Based on a frequency analysis of discharges at the U.S.G.S. Moravian Drive gage, conditions were determined to be unchanged from the original FIS. A floodway model was also developed utilizing the HEC-2 encroachment option.

As a result of the changes to the hydrologic and hydraulic models, there are inconsistencies with the profiles and/or hydrology for adjacent areas. These include the Red Run Drain in Clinton Township, Sterling Heights and possibly Warren, and on the Clinton River in Sterling Heights.

The work map used in this study is an enlargement of the U.S.G.S. Mt. Clemens West 7.5 minute quadrangle map. It is the same map used in the original study except for the photorevision of 1980. The stationing along the stream was established so that it matches the existing FIS at Moravian Drive and Garfield Road (the old location). At intermediate locations there is some minor differences in the stationing as evidenced by small changes in the locations of cross sections. The flood plain delineation was supplemented over much of the study area by use of a 2 foot contour interval topographic map. The map was produced for the U.S. Army Corps of Engineers, Detroit District from aerial photography flown in April 1978. The MDNR supplied site maps for several subdivision developments which also contained varying levels of topographic information. Due to the more detailed mapping available on the supplemental sources, at some locations the flood plain delineations are not compatible with contour lines shown on the work map. The floodway and flood plain delineations were discontinued in the area of the North Branch of the Clinton River, at a location were there was no change from the existing study.

During the survey for this study, an error was discovered in the published elevation for RM 3. The elevation is not 599.92. It should be 600.96.

Enclosed for your information are HEC-2 output for the 100- and 500-year profile, an encroached run, and a work map for the revised study area of the Clinton River in Clinton Township.

Re: Hydraulic Computations
Clinton Township FIS
City of Sterling Heights FIS

Ref: J&A File Nos. 5670-02, 10-1

Dear Mr. Morgan:

Enclosed are our hydraulic computations (plan & profile, HEC-2 input, output and J&A IPLOT, and hydraulic analysis book) for the following:

1. Clinton River
2. Clinton River Spillway
3. Clinton River Main Branch
4. Clinton River Middle Branch
5. Clinton River North Branch
6. Miller Drain

We would appreciate your review and approval of these computations as soon as possible.

Sincerely,

William C. Rossow

TABLE OF CONTENTS

Introduction

The streams being studied are the Clinton River, Clinton River Spillway, North Branch of the Clinton River, Middle Branch of the Clinton River and Miller Drain in Clinton Township, Macomb County, Michigan. The Clinton River is also being studied in the City of Sterling Heights, Macomb County, Michigan. The study limits on the Clinton River run from the eastern boundary of Clinton Township through the northern boundary of the City of Sterling Heights. The Clinton River Spillway is being studied upstream from the eastern boundary of Clinton Township to its confluence with the Clinton River. In north central Clinton Township there is a place known as the Forks Area. In this small area, the Miller Drain joins the Middle Branch of the Clinton River which in a very short distance joins the North Branch of the Clinton River, which promptly runs into the Clinton River. The Miller Drain, Middle Branch and North Branch are being studied from their downstream limits in the Forks Area to the points where they each exit Clinton Township at its northern boundary. The date of field survey was the summer and fall of 1976.

The discharges were computed using three methods including the Unit Hydrograph-Infiltration Capacity Method developed by Dr. Ernest F. Brater, gage analysis and standard flood routing techniques. Each of these methods were used where they were found to be most appropriate. The 10-, 50-, 100-, and 500-year flood frequency flows used in this study have been accepted by the Michigan Department of Natural Resources (letter dated April 5, 1977). Of these flows only those below the confluence of the Clinton River and Clinton River Spillway are on a tenative basis.

based on rating curve (divided flow situation)

The Project Manager for this analysis is William C. Rossow, P.E.

Method of Analysis

Water-surface profiles were computed by the HEC-2 Standard Step-Backwater Computer Program developed by the U. S. Army Corps of Engineers.[1]

The hydraulic model was developed for the 100-year flow. The "Normal Bridge" Routine was used for constrictions under low flow conditions for the 100-year discharge or when all four flows were fully submerged. The "Special Bridge" Routine was used for constrictions that experienced pressure flow for the 100-year discharge. All constrictions were inspected for inlet control.

Valley sections upstream and downstream of culverts were located where full cross-section flow would be developed out of the influence of the bridge constriction. The criteria for placement of these sections were those outlined on pages 18-21 of the HEC Training Document No. 6 Application of the HEC-2 Bridge Routines. Accordingly, the downstream section was placed at a distance of about four times the average length of the side constriction caused by the bridge abutment. The upstream section was placed at a distance about equal to the bridge constriction. If the actual field-surveyed cross-section fell within this distance, this section was encroached as appropriate.

Starting Point

Profile computations for the Miller Drain, Middle Branch of the Clinton River and the North Branch of the Clinton River were begun at the mouth of each stream. The water surface elevations were determined by backwater curves started at Lake St. Clair and carried on up to the mouth of each stream. From the profiles, stage discharge curves were established at the mouth of each stream. The flow used below the confluence were those when the stream in question was at peak discharge. The Clinton River and Clinton River Spillway were begun at the mean annual flood level of Lake St. Clair.

Variables and Coefficients

The roughness factors (Manning's "n"), taking into account the proper season were established by comparing the photographs and descriptions found on pages 101-123 in Open-Channel Hydraulics by Ven Te Chow, with photographs and field inspection trips taken at every cross-section. For the Clinton River up to the Forks Area, Clinton River Spillway and North Branch, the proposed flood season is late spring. For all other streams it is summer. The variation of roughness was taken into account by use of the NH card with due consideration made of conditions existing upstream and downstream of the given section.

The coefficient of contraction varied from 0.1 (Reflecting a gradual change) to 0.5 (used for abrupt changes). The coefficient of expansion ranged from 0.3 to 1.0 for gradual to abrupt changes respectively.

The total loss coefficient (XKOR) used in the HEC-2 "Special Bridge" routine was determined as outlined in Exhibit 2 of the HEC-2 Users Manual. The inlet coefficients were taken from tables published by the Bureau of Public Roads.[2]

For inlet control, nomographs from the Bureau of Public Roads[2] were used. The weir discharge and submergence coefficients were taken from charts supplied by the Michigan Department of Natural Resources.[3]

Synthetic Cross-Section

Synthetic cross-sections utilized in the hydraulic analysis were developed in three ways. The three methods used were blending of the two cross-sections, repetition of a field-surveyed cross-section with appropriate invert and area adjustment, or interpolating between two field surveyed cross-sections using the Johnson & Anderson, Inc., AVSEC computer program. The AVSEC program develops an average cross-section by averaging the overbanks and channel of the two known cross-sections.

Since inverts are known only at field sections, a straight line is assumed between these known points.

Special Conditions

For the purpose of finding a starting water surface elevation for the Clinton River at the confluence of the Clinton River Spillway the split of flow between the streams had to be determined. A family of backwater curves were run up each stream to the confluence. Downstream of Clinton Township, field data was supplied for this purpose by the Detroit District, Army Corps of Engineers from their Harrison Township Flood Insurance Study. From the results, energy versus discharge curves were drawn for each stream.

By assuming that the energies of the Clinton River and Clinton River Spillway would be equal at their confluence, the two energy versus discharge curves were

combined to give a total discharge versus energy curve. By use of these relationships, given a flow above the confluence the proper split of flow between the Clinton River and Clinton River Spillway plus the starting energy for the total flow can be found. The results obtained from these curves were used to input the water surface at SECNO 8.717 through the use of an X5 card.

The selection of Manning's "n" values was aided on several portions of the basin by the existance of stream gages. Two gages are on the Clinton River, one being 10.846 miles above the mouth at Moravian Drive and other 15.73 miles above the mouth near Garfield Road. The only other gage within the study area is on the North Branch of the Clinton River at Hall Road. For each case a number of low flows were run in the stream with the "n" values being adjusted until the stage-discharge relationship was matched. These values were then used with the flood flows. no back up results.

Immediately downstream of the Red Run Drain on the Clinton River the maximum peak discharges are caused by the Red Run Drain. Due to the different times of concentration, the Red Run Drain peaks at the confluence before the Clinton River. * Because of this, a new run was made upstream of the Red Run Drain at the time of peak for the Clinton River. This run will be carried upstream to the limits of the study. In the final report, Clinton River flood elevations due to the Red Run Drain peak flow, will be extended horizontally until the corresponding Clinton River profiles are intersected.

ok approx but why not a M1 or backwater curve

* 100 yr st. W.S., Red Run Dr. @ 601.4
100 yr W.S., Clinton River @ confluence is 602.44 (to be superposed)

CLINTON TOWNSHIP FLOOD INSURANCE STUDY
CLINTON RIVER MAIN JMA NO. 5670-02
PROJECT MANAGER WILLIAM ROSSOW (continuation of Harrison Twp study)

(computer run - From Lk St. Clair to confluence / Red Run)

FIELD SECTION	SECNO	DESCRIPTION
A	6.057	VALLEY SECTION A RIGHT ENCROACHMENT DUE TO HOUSES
B	6.489	VALLEY SECTION B RIGHT ENCROACHMENT DUE TO STRUCTURES
C	6.883	VALLEY SECTION C LEFT ENCROACHMENT DUE TO BUILDING LINE
D	7.096	VALLEY SECTION D
	7.142	BRIDGE SECTION E RELOCATED GROUND POINTS ONLY SECTION SKEWED FOR PERPENDICULARITY TO MASS OF FLOW
	7.143	BRIDGE SECTION E DICKINSON STREET DOWNSTREAM FACE SECTION SKEWED FOR PERPENDICULARITY TO MASS OF FLOW
E	7.154	BRIDGE SECTION E DICKINSON STREET UPSTREAM FACE SECTION SKEWED FOR PERPENDICULARITY TO MASS OF FLOW
	7.155	BRIDGE SECTION E RELOCATED GROUND POINTS ONLY SECTION SKEWED FOR PERPENDICULARITY TO MASS OF FLOW
	7.163	VALLEY SECTION F RELOCATED INVERT ADJUSTED DISTANCE EQUAL TO BRIDGE CONTRACTION
F	7.222	VALLEY SECTION F
	7.253	VALLEY SECTION F RELOCATED INVERT ADJUSTED DISTANCE EQUAL TO BRIDGE EXPANSION
	7.288	BRIDGE SECTION G RELOCATED GROUND POINTS ONLY
	7.289	BRIDGE SECTION G CROCKER BLVD. DOWNSTREAM FACE
G	7.296	BRIDGE SECTION G CROCKER BLVD. UPSTREAM FACE
	7.297	BRIDGE SECTION G RELOCATED GROUND POINTS ONLY
	7.300	VALLEY SECTION F RELOCATED INVERT ADJUSTED DISTANCE EQUAL TO BRIDGE CONTRACTION LEFT ENCROACHMENT DUE TO FLOW CONTRACTION
H	7.731	VALLEY SECTION H RIGHT ENCROACHMENT DUE TO HOUSE LINE
I	8.023	VALLEY SECTION I LEFT ENCROACHMENT DUE TO HOUSE LINE ? ENCROACHMENT ON 10-YEAR FLOW AT RIGHT SIDE DUE TO HIGH GROUND
J	8.278	VALLEY SECTION J RIGHT ENCROACHMENT DUE TO HIGH GROUND LEFT ENCROACHMENT DUE TO HIGH GROUND

K	8.713	VALLEY SECTION K RIGHT ENCROACHMENT DUE TO HIGH GROUND
	8.717	VALLEY SECTION MANUFACTURED FROM CLINTON RIVER SECTION K AND CLINTON RIVER SPILLWAY SECTION D RIGHT ENCROACHMENT DUE TO HIGH GROUND
	8.922	VALLEY SECTION INTERPOLATED DUE TO LARGE VELOCITY CHANGE RIGHT ENCROACHMENT DUE TO FLOW EXPANSION
	8.972	VALLEY SECTION INTERPOLATED DUE TO LARGE VELOCITY CHANGE RIGHT ENCROACHMENT DUE TO FLOW EXPANSION
	9.023	VALLEY SECTION INTERPOLATED DUE TO LARGE VELOCITY CHANGE RIGHT ENCROACHMENT DUE TO FLOW EXPANSION
L	9.074	VALLEY SECTION L RIGHT ENCROACHMENT DUE TO FLOW EXPANSION
	9.106	VALLEY SECTION INTERPOLATED DUE TO LARGE VELOCITY CHANGE LEFT ENCROACHMENT DUE TO FLOW EXPANSION SECTION SKEWED FOR PERPENDICULARITY TO MASS OF FLOW
	9.137	BRIDGE SECTION M RELOCATED GROUND POINTS ONLY SECTION SKEWED FOR PERPENDICULARITY TO MASS OF FLOW ENCROACHMENTS DUE TO BRIDGE OPENING
	9.138	BRIDGE SECTION M N.B. GRATIOT AVE. DOWNSTREAM FACE SECTION SKEWED FOR PERPENDICULARITY TO MASS OF FLOW
M	9.150	BRIDGE SECTION M N.B. GRATIOT AVE. UPSTREAM FACE SECTION SKEWED FOR PERPENDICULARITY TO MASS OF FLOW
	9.151	BRIDGE SECTION M RELOCATED GROUND POINTS ONLY SECTION SKEWED FOR PERPENDICULARITY TO MASS OF FLOW ENCROACHMENTS DUE TO BRIDGE OPENING
	9.213	BRIDGE SECTION N RELOCATED GROUND POINTS ONLY SECTION SKEWED FOR PERPENDICULARITY TO MASS OF FLOW ENCROACHMENTS DUE TO BRIDGE OPENING

JOB NAME: STERLING HEIGHTS, FIS | JOB NO. 5670 | 10 | 37

WATERCOURSE: CLINTON RIVER, MAIN BRANCH | CULVERT LOCATION: Van Dyke Road Bridge

CULVERT DESCRIPTION: Box culvert with one pier — no wingwalls at [illegible] | BY BEH | DATE 12-29-76

WEIR DESCRIPTION: Roadway with 72 foot breadth

MAX [illegible] 620.2

EL. 618.1 MIN ELT[illegible]

EL. 608.3

EL. 608.3

So = [illegible]

L = 74

Sta. 24.514 | Sta. 27.490

A = 740.3 D = 11.9

WP = 211.0 Ke = 0.5

$\frac{29.1}{R^{4/3}}$ = 5.4711 n = 0.02491

CALCULATIONS AND COMMENTS:

- Manning's n -

$$n = \left(\frac{(.03^2 \times 46.5 \times 2) + (.02^2 \times [illegible].5 \times 2) + (.03^2 \times 25)}{211} \right)^{1/2}$$

$n = 0.02491$

- XKOR -

$XKOR = 1 + K_e + \frac{29.1}{R^{4/3}} n^2 L$

$XKOR = 1 + 0.5 + (5.4711)(.02491)^2 74$

$XKOR = 1.751$

- COFQ -

Assume initial H=1.0 then

$\frac{H}{L} = \frac{1}{72} = .0134 < .15$

so use

$H = 1.0 \Rightarrow COFQ = 3.03$

JOB NAME: STERLING HEIGHTS, FIS JOB NO. 5670 | 10 | 56B

WATERCOURSE: CLINTON RIVER, MAIN BRANCH CULVERT LOCATION:

CULVERT DESCRIPTION: Box culvert with piers but no wingwalls nor headwalls

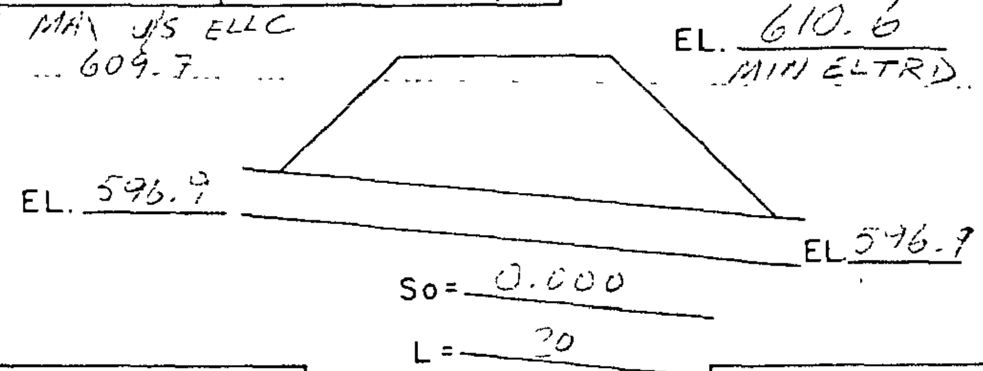
BY BEH DATE 12-29-76

WEIR DESCRIPTION: Broken slants - huge holes in girder back - 18' breadth

A = 486.4 D = 12.8

WP = 189.5 Ke = 0.5

$\frac{29.1}{R^{4/3}}$ = 8.3046 n = .02841



Sta. 21.846 Sta. 21.843

CALCULATIONS AND COMMENTS:

- Manning's n -

$$n = \left(\frac{(.035^2 \times 57)+(.025^2 \times 9.5 \times 6)+(.025^2 \times 9.5 \times 2)+.025^2(57)}{189.5}\right)^{1/2}$$

$n = .02841$

- XKOR -

$XKOR = 1 + Ke + \frac{29.1}{R^{4/3}} n^2 L$

$XKOR = 1 + 0.5 + (8.3046)(.02841)^2 20$

$XKOR = 1.6341$

- COFQ -

Assume initial H = 1.0

then $\frac{H}{L} = \frac{1}{18} = .055 < .15$

therefore use

H = 1.0 => COFQ = 3.03

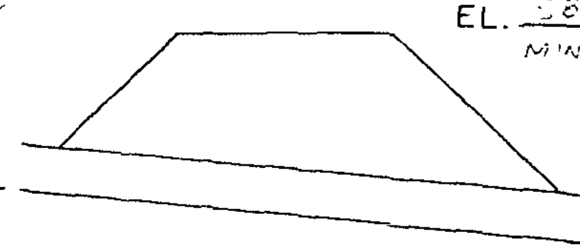
JOB NAME: CLINTON TOWNSHIP, FIS — JOB NO. 5670 | 02 | 112A

WATERCOURSE: MIDDLE BRANCH, CLINTON RIVER — CULVERT LOCATION: 2300' U/S OF HEYDENREICH ROAD

CULVERT DESCRIPTION: WOOD BRIDGE WITH CONCRETE HEADWALLS AND NO WINGWALLS

BY BEH — DATE 12/30/76

MAX U/S ELEV 587.4



WEIR DESCRIPTION: PLANKING WITH 12 FOOT BREADTH

A = 1978 — D = 10.7

WP = 569 — Ke = 0.5

$\frac{29.1}{R^{4/3}}$ = 5.5494 — n = .0210

So = 0.0000 — L = 14

Sta. 61+34 — Sta. 61+20

CALCULATIONS AND COMMENTS:

— MANNINGS n —

$$n = \left(\frac{.015^2 \times 169 + .013^2 \times 20 + .03^2 \times 20}{569}\right)^{1/2}$$

$$n = .0210$$

— XKOR —

$$XKOR = 1 + Ke + \frac{29.1\, n^2 L}{R^{4/3}}$$

$$XKOR = 1 + 0.5 + (.0210)^2 (5.5494)\, 14$$

$$XKOR = 1.534$$

— COEF —

ASSUME H=1.0 FOR INITIAL RUN

$\frac{H}{L} = \frac{1}{12} = .083 < .15$

∴ USE H=1.0

COEF = 3.04

Johnson & Anderson, Inc.

HYDRAULIC ANALYSIS

Introduction

The stream being studied is the Harrington Drain in Clinton Township, Macomb County, Michigan. The study limits are from its mouth at the Clinton River to Fifteen Mile Road. The date of field survey was September, 1976.

The summer discharges were computed by the unit hydrograph-infiltration capacity method developed by Dr. Ernest F. Brater. The 10-, 50-, 100- and 500-year flood frequency flows used in this study have been tentatively accepted by the Michigan Department of Natural Resources (letter dated October 28, 1976).

The project Manager for this analysis is William C. Rossow, P.E.

Method of Analysis

Water-surface profiles were computed by the HEC-2 standard step-backwater computer program developed by the U.S. Army Corps of Engineers.[1]

The hydraulic model was developed for the 100-year flow. The "normal bridge" routine was used for constrictions under low flow conditions for the 100-year discharge. The "special bridge" routine was used for constrictions that experienced pressure flow for the 100-year discharge. A hand calculation was used for the 500-year under pressure flow if the constriction was coded for low flow. All constrictions were inspected for inlet control.

Valley sections upstream and downstream of culverts were located where full cross-section flow would be developed out of the influence of the bridge constriction. The criteria for placement of these sections were those outlined on pages 18-21 of the HEC Training Document No. 6, Application of the HEC-2 Bridge Routines. Accordingly, the downstream section was placed at a distance of about four times the average length of the side constriction caused by the bridge abutment. The upstream section was placed at a distance about equal to the bridge constriction. If the actual field-surveyed cross section fell within this distance, this section was encroached as appropriate.

Starting Point

Profile computations for the Harrington Drain were begun at its confluence with the Clinton River. The water-surface elevations in the Clinton River at the Harrington Drain were determined by a backwater curve starting at
not submitted
Lake St. Clair with the mean annual flood elevation. The flows used in the Clinton River were those when the Harrington Drain was at peak discharge.

Since critical depth for the Harrington Drain is at a higher elevation than the water surface in the Clinton River, a free outfall exists. Therefore the profile computations for the Harrington Drain were started at * critical depth.

Variables and Coefficients

The roughness factors (Manning's "n") were established by comparing the photographs and descriptions found on pages 101 to 123 in Open-Channel

* see DNR check on J&A computer output (100-yr profile)

Hydraulics by Ven Te Chow, with photographs and field inspection trips taken at every cross section. Each cross section was analyzed using average values in the lateral direction of the longitudinal roughness variation.

The contraction and expansion coefficients used between cross sections were 0.1 and 0.3, respectively, which reflect gradual transitions.

The contraction and expansion coefficients used at constrictions not experiencing weir flow were 0.5 and 1.0, respectively, which reflect the sudden transitions found between the bridge section and valley section. Depending upon the amount of weir flow, these coefficients were reduced as the contraction and expansion losses became less.

The total loss coefficient (XKOR) used in the HEC-2 "special bridge" routine was determined as outlined in Exhibit 2 of the HEC-2 Users Manual.[1] The individual coefficients were taken from tables published by the Bureau of Public Roads.[2]

For inlet control, nomographs from the Bureau of Public Roads[2] were used. If nomographs did not exist for a particular bridge, then the equation $\left|\frac{V^2}{2g} + \frac{1}{C^2}\right| + \frac{D}{2} = HW^{3.4}$ was used if the entrance was submerged. If the entrance was unsubmerged, then either the weir principle was applied or the culvert was made equivalent to a round pipe[5] to be solved. The weir discharge and submergence coefficients were taken from charts supplied by the Michigan Department of Natural Resources.

Synthetic Cross Sections

Synthetic cross sections utilized in the hydraulic analysis were developed in three ways. The three methods used were blending of the two cross sections, repetition of a field-surveyed cross section with appropriate invert and area adjustment, or interpolating between two field-surveyed cross sections using the Johnson & Anderson, Inc., AVSEC computer program. The AVSEC program develops an average cross section by averaging the overbanks and channel of the two known cross sections.

Since inverts are known only at field sections, a straight line is assumed between these known points.

Sensitivity of the Roughness Coefficients

Two backwater runs were made for the 100-year flood varying only the roughness coefficients. An increase of the Manning "n" by 30 percent resulted in an increase in water-surface elevation by approximately 0.95 feet. A decrease of the Manning "n" by 30 percent resulted in a drop in water surface by approximately 1.23 feet. (comparision runs not submitted)

RE: Clinton Township Flood Insurance Study
Hydraulic Analyses Report

Dear Mr. Menerey:

Enclosed is the Hydraulic Analyses Report for the Clinton Township Flood Insurance Study (FIS). Clinton Township is located in Macomb County, Michigan. This report was generated for the Federal Emergency Management Agency (FEMA) as part of the National Flood Insurance Program (Contract No. EMW-91-C-3361).

The enclosed report summarizes the technical analyses which were performed to assess flooding conditions in Clinton Township. These analyses included the estimation of flood plain elevations and limits, and floodway location for the Miller Drain, and Middle Branch and North Branch of the Clinton River.

Your review of this report is requested. Upon receipt of approval of the results presented in this report, STS will proceed with finalizing the FIS for Clinton Township. If you have any questions regarding the enclosed report, please contact us at (517) 321-4964.

Sincerely,

STS CONSULTANTS, LTD.

TABLE OF CONTENTS

Clinton Township Flood Insurance Study
Final Hydraulic Analyses Report

1.0 INTRODUCTION

The Clinton Township Flood Insurance Study (FIS) is being performed for the Federal Emergency Management Agency (FEMA) as part of the National Flood Insurance Program. Clinton Township is located in Macomb County, Michigan and a vicinity map is presented as Figure 1. The location of Clinton Township within Macomb County is presented in Figure 2. The detailed technical studies performed for the FIS were completed in two steps. The Hydrologic Analyses Report was the first step, and is preceded by this Hydraulic Analyses Report. This report provides a re-analysis of a previously completed study.

The objective of the hydraulic analysis phase of the project was to develop floodway and flood plain limits and elevations for the stream systems designated for detailed study. The scope of this study includes the performance of hydraulic analyses for the following:

1. Miller Drain — The mouth of the Miller Drain is confluent with the Middle Branch of the Clinton River and will be studied from the confluence upstream approximately 1.9 miles to the corporate limits.

2. Middle Branch — The mouth of the Middle Branch of the Clinton River is confluent with the North Branch of the Clinton River and will be studied from the confluence approximately 3.0 miles upstream to the corporate limits.

3. North Branch — The mouth of North Branch of the Clinton River is confluent with the Clinton River and will be studied from the confluence approximately 3.2 miles upstream to the corporate limits.

The locations of these watercourses within Clinton Township are illustrated in Figure 1. The peak flows developed from the hydrologic analysis were used during the hydraulic analysis of the project. Except for the Middle Branch, this study utilized the same flows as the original study of 1979.

2.0 HYDRAULIC ANALYSIS

2.1 General

Flood insurance studies were initially performed in 1979 for Clinton Township. A new flood insurance study was originally re-evaluated by STS due to the following changes in the hydraulic of the Miller Drain, Middle Branch and North Branch.

1) Reconstructed Heydenreich Road Bridges over the Miller Drain and the Middle Branch.

2) New channel configuration on the upstream portion of the Miller Drain.

After STS initiated the study, it was learned that the Little Road Bridge was removed and this change was then incorporated into the study. The hydrology has also been re-evaluated and approved by the Michigan Department of Natural Resources, Land and Water Management Division by a letter dated December 17, 1993. A summary of the MDNR approved hydrologic analysis discharges are presented in Table 1.

TABLE 1
Clinton Township Final Hydrologic Analysis

	Discharges in cfs Recurrence Intervals			
	10-yr	50-yr	100-yr	500-yr
Miller Drain				
@ mouth	260	380	430	590
North Branch Clinton				
u/s of M-59	5,440	8,970	10,700	15,300
d/s of M-59	5,440	8,410	9,720	13,100
u/s of Middle Branch Clinton	5,250	8,260	9,590	13,000
d/s of Middle Branch Clinton	6,710	10,200	11,600	15,500
Middle Branch Clinton				
u/s of Miller Drain	2,000	3,250	3,900	5,430
@ mouth	2,190	3,540	4,240	5,900

2.2 Methodology

The Army Corps of Engineers' HEC-2 computer model *(Reference 1)* was utilized to simulate the 10-, 50-, 100- and 500-year flood events and to estimate water surface elevations. This program simulates water surface profiles for steady, gradually varied flow in natural or manmade channels based on the solution of the one-dimensional energy equation. Energy losses due to friction are evaluated using Manning's Equation *(Reference 2)*. The program has the capability to assess the impacts of various obstructions to flow, including bridges, culverts and weirs. The computational procedure utilized by the program is generally known as the standard step method. Parameters that were input to the HEC-2 computer model include stream, bridge and culvert cross-section dimensions and elevations; roughness coefficients associated with the stream bed and overbank areas; expansion and contraction loss coefficients; and the distance between cross-sections and structures.

2.2.1 Starting Point

Profile computations for the Miller Drain, Middle Branch and North Branch of the Clinton River were begun at the mouth of each stream. The starting water surface elevations were determined from the 1979 FIS study. These water surface elevations were determined by backwater curves started at Lake St. Clair and carried on up to the mouth of each stream. From the profiles, stage discharge curves were established at the mouth of each stream. The flow used below the confluence were those when the stream in question was at peak discharge. The Clinton River and Clinton River Spillway were begun at the mean annual flood level of Lake St. Clair.

2.3 Miller Drain

In August 1991, a topographic survey was performed by Abrams Aerial Survey Corporation to develop maps with a scale of 1 inch equals 400 feet, with 2 foot contours. On May 1, 1992, a land survey was performed by STS. Two detailed cross-sections of the Miller Drain were obtained. This information was utilized to develop the cross-sections for the HEC-2 model. The following is the hydraulic model changes from the 1979 model, made by STS, for the Miller Drain.

1) Recorded bridge data for Heydenreich Road Bridge.

2) Changed contraction and expansion coefficients between Heydenreich crossing and Section No. 2270.

3) Adjust miscellaneous bank locations

4) Added Section No. 7390 to define downstream limit of channelized portions of drain.

5) Updated ground points data for Section Nos. 8510 to 10220 to reflect channelization.

6) Fixed numerous miscellaneous input errors and warning messages in original model[1].

Table 2 presents a cross-section reference between cross-section designations for the HEC-2 model, the land survey, and mapping in the FIS distances between cross-sections and structures for both the channel and overbank areas were obtained from the work map that was generated from the aerial survey.

Manning's Equation coefficients utilized in the computer model ranged from 0.03 to 0.08 for the stream channel and ranged from 0.04 to 0.1 in the stream overbank areas. Contraction and expansion coefficients *(Reference 3)* were established as 0.1 and 0.3 for smooth transitions, and 0.3 and 0.5 for abrupt transitions.

2.3.1 Results

Table 3 presents the floodplain elevations for the 10, 50, 100, and 500 year floods. Due to the backwater effect of the North Branch, flood elevations would be controlled by the North Branch. Re-evaluated flood elevations compared to the 1979 model did not change significantly. Vertical profiles of the Miller Drain flood elevations are presented in Appendix A.

2.4 North Branch Clinton River

In August 1991, a topographic survey was performed by Abrams Aerial Survey Corporation to develop maps with a scale of 1 inch equals 400 feet, with 2 foot contours. On May 1, 1992, a land survey was performed by STS, and two detailed cross-sections of the North Branch were obtained at the former Little Road crossing. This information was utilized to develop the cross-sections for the HEC-2 model. The following is hydraulic model changes from the 1979 model, made by STS, for the North Branch of the Clinton River.

1) Corrected X3.10 data for Cass Avenue Bridge.
2) Fixed numerous miscellaneous input errors and warnings present in original model[2].
3) Adjust miscellaneous bank station locations.
4) Remove bridge data for old Little Road Crossing.

---

[1] Many changes were necessitated due to revisions to the HEC-2 code.

[2] Many errors were due to revised HEC-2 code.

TABLE 2
Miller Drain Cross-Section Locations

HEC-2 Designation	FIS Map Designation	Description
850.0	A	850′ upstream of confluence with Middle Branch Clinton River.
989.0		1′ downstream of Heydenreich Road Bridge.
990.0		Downstream face of Heydenreich Road Bridge.
1,010.0	B	Upstream face of Heydenreich Road Bridge.
1,011.0		1′ upstream of Heydenreich Road Bridge.
2,270.0	C	1,259′ upstream of the Heydenreich Road Bridge.
3,200.0	D	2,189′ upstream of the Heydenreich Road Bridge.
3,662.0		Downstream of Private Bridge.
3,663.0		1′ downstream of Private Bridge.
3,675.0		Upstream of Private Bridge.
3,676.0		1′ upstream of Private Bridge.
4,800.0	E	92′ downstream of Dunham Road Bridge.
4,892.0	F	Downstream face of Dunham Road Bridge.
4,926.0		Upstream face of Dunham Road Bridge.
5,101.0		175′ upstream of the Dunham Road Bridge.
6,610.0	G	1,684′ upstream of the Dunham Road Bridge.
7,390.0		2,464′ upstream of the Dunham Road Bridge.
8,510.0	H	1,710′ downstream of Clinton Township corporate limits.
10,220.0	I	Clinton Township corporate limits.

TABLE 3
Miller Drain Flood Elevation

Cross-Section	10-yr.	50-yr.	100-yr.	500-yr.
850	581.10	583.10	584.20	587.00
989	584.41	584.20	584.61	587.07

10,220	592.20	593.05	593.34	594.08

Table 4 presents a cross-section reference between cross-section designations for the HEC-2 model, the land survey, and mapping in the FIS distances between cross-sections and structures for both the channel and overbank areas were obtained from the work map that was generated from the aerial survey.

Manning's Equation coefficients utilized in the computer model ranged from 0.045 to 0.068 for the stream channel and ranged from 0.04 to 0.1 in the stream overbank areas. Contraction and expansion coefficients *(Reference 3)* were established as 0.1 and 0.3 for smooth transitions, and 0.3 and 0.5 for abrupt transitions.

2.4.1 Results

Table 5 presents the floodplain elevations for the 10, 50, 100, and 500 year floods. Re-evaluated flood elevations compared to the 1979 model did not change significantly. Vertical profiles of the North Branch flood elevations are presented in Appendix A.

2.5 Middle Branch Clinton River

In August 1991, a topographic survey was performed by Abrams Aerial Survey Corporation to develop maps with a scale of 1 inch equals 400 feet, with 2 foot contours. This information was utilized to develop the cross-sections for the HEC-2 model. The following is hydraulic model changes from the 1977 model, made by STS, for the Middle Branch of the Clinton River.

1) Recorded bridge data for Heydenreich Road Bridge replacement, including weir data for road changes.

2) Fixed numerous miscellaneous input errors and warnings present in original model[1].

3) Changed contraction and expansion coefficient between Heydenreich Road and Section Number 6120.

4) Increased flood discharges based on approved changes. Above Miller drain, adjusted QT data based on same flow proportions as original model. Method approved by MDNR.

5) Recorded ground data for sections 5050 and 11700 based on revised topographic mapping.

---

[1] Many errors were due to changes in the HEC-2 code.

TABLE 4
North Branch Cross-Section Locations

HEC-2 Designation	FIS Map Designation	Description
300.0	A	300' upstream of confluence with Clinton River.
858.0		Downstream face of Cass Avenue Bridge.
944.0	B	Upstream face of Cass Avenue Bridge.
1,244.0		Upstream of confluence with Middle Branch
1,650.0	C	1,650' upstream of confluence with Clinton River
4,670.0	D	4,670' upstream of confluence with Clinton River
7,680.0	E	7,680' upstream of confluence with Clinton River

Table 6 presents a cross-section reference between cross-section designations for the HEC-2 model, the land survey, and mapping in the FIS distances between cross-sections and structures for both the channel and overbank areas were obtained from the work map that was generated from the aerial survey.

Manning's Equation coefficients utilized in the computer model ranged from 0.02 to 0.07 for the stream channel and ranged from 0.04 to 0.09 in the stream overbank areas. Contraction and expansion coefficients *(Reference 3)* were established as 0.1 and 0.3 for smooth transitions, and 0.3 and 0.5 for abrupt transitions.

2.5.1 Results

Table 7 presents the floodplain elevations for the 10, 50, 100, and 500 year floods. Due to the backwater effect of the North Branch, flood elevations would be controlled by the North Branch. Re-evaluated flood elevations compared to the 1979 model did not change significantly. Vertical profiles of the Middle Branch flood elevations are presented in Appendix A.

2.6 Floodway Calculation

The floodway for the three branches were calculated with HEC-2 encroachment method 1 and encroachment method 4. The floodways were determined by calculating a maximum increase in the base flood (100-year flood) water surface elevation of 0.1 feet increase. HEC-2 encroachment method 1 involves inputted encroachment stations in the right and left channels until a rise of 0.1 feet occurs in the floodway. HEC-2 encroachment method 4 computes encroachment stations based on the desired change in water surface elevation of 0.1 feet. Table 8 presents the floodway results for the North Branch, Middle Branch, and Miller Drain.

Note: Middle Branch and Miller Drain have backwater effect from the Clinton River.

3.0 COMPARISON OF RESULTS

The hydraulic profile of the Miller Drain, determined for the 1979 FIS has been changed. The floodway for Miller Drain, Middle Branch and North Branch have also recalculated from the 1979 study due to the updating of the HEC-2 code. The HEC-2 model has calculated the new floodways and are redrawn on 1979 FIRM map presented in Appendix C.

The floodplain and floodway for the North Branch of the Clinton River did not change significantly from the previous study. The position of the North Branch was better defined from Abrams Aerial Survey. Because of the reposition of the North Branch, the location of the floodway and floodplain did change from the 1979 FIS and are redrawn on the 1979 FIRM map.

The floodplain and floodway of the Miller Drain did change downstream of the corporate limits due to the rechannelization of the river. Further downstream of the Miller Drain, the floodplain and floodway did not change significantly.

The floodplain and floodway of the Middle Branch of the Clinton River did not change significantly from the previous study except at areas where the river location has changed based on the Abrams Aerial Survey.

4.0 CONCLUSIONS

STS has perform this hydraulic analysis report for the Clinton Township Flood Insurance Study. Specifically, the North Branch of the Clinton River, Middle Branch of the Clinton River, and the Miller Drain. This report was generated for the Federal Emergency Management Agency as part of the National Flood Insurance Program (contract no. EMW-91-C-3361).

The flood insurance study for the three branches of the Clinton River were initially performed in 1979. A new insurance study was performed due to the reconstruction of the Heydenreich Road Bridge over the Miller Drain and the Middle Branch, and a new channel configuration on the upstream portion of the Miller Drain.

The hydraulic analysis has shown that there has not been a significant change in the floodway and floodplain of the three branches of the Clinton River since the 1979 report, due to the reconstruction of the Heydenreich Road Bridge over the Miller Drain and the Middle Branch of the Clinton River. The floodway and floodplain location did change, however, due to the new channel configuration on the upstream portion of the Miller Drain.

Mr. James Sinnamon
Clinton Township Supervisor
Macomb County
40700 Romeo Plank Road
Clinton Township, Michigan 48038

Dear Mr. Sinnamon:

Please find enclosed two preliminary copies of the revised areas of the Flood Insurance Study (FIS) and Flood Insurance Rate Map (FIRM) for the Township of Clinton, Macomb County, Michigan. We have completed our technical evaluation of the available data and have incorporated the appropriate changes into the enclosed copies. A description of the changes with the corresponding affected portions of the FIS and FIRM is attached for your information and review.

Users of this FIRM should be aware that these maps have been computer generated. Once the FIS and FIRM are published in final format, the digital files containing the flood hazard data can be provided to your community for use in a computer mapping system. These files can be used in conjunction with other thematic data for floodplain management purposes, insurance determinations, and many other planning applications. In addition, your community may be eligible for additional credits under the Community Rating System if you implement your activities using digital mapping files.

The digital files containing the roads, road names, and corporate limits for Township of Clinton were obtained from STS Consultants, Ltd.

If you have any comments that might justify modifying our results, please use one copy of the enclosed map(s) to identify the area of concern and return it to us within 30 calendar days from the date of this letter. If you are in agreement with our findings, please respond with a letter stating that you have reviewed the accompanying material. If we do not receive any comments within 30 days, we will continue processing.

Following the 30-day review period, we will publish a notice of proposed Base (1% annual chance) Flood Elevation (BFE) determinations in your local newspaper. This notice will initiate a 90-day period during which your community may submit appeals or comments on the proposed BFEs reflected in the revised FIS and FIRM for your community. Following the 90-day appeal period and the resolution of any appeals, we will finalize the proposed BFEs and establish an effective date for the revised study.

If you have any questions, please contact the Director, Mitigation Division of the Federal Emergency Management Agency in Chicago, Illinois at (312) 408-5548.

Sincerely,

Frederick H. Sharrocks Jr., Chief
Hazard Identification Branch
Mitigation Directorate

TOWNSHIP OF CLINTON, MACOMB COUNTY, MICHIGAN

The Flood Insurance Study (FIS) and Flood Insurance Rate Map (FIRM) for the Township of Clinton have been revised to incorporate updated hydrologic and hydraulic analyses of the Clinton River North Branch, the Clinton River Middle Branch, and the Miller Drain. These analyses were prepared for the Federal Emergency Management Agency (FEMA) by STS Consultants, Ltd.

In addition, a previously issued Letter of Map Revision dated March 20, 1995 and previously issued Letters of Map Revision Based on Fill dated April 20, 1993 and December 17, 1993 have been added to the FIS Report and FIRM in this revision.

The following is a summary of changes to the FIRM and FIS Report:

FIRM number 260121, panels 0005 and 0010

The 1% (100-year) annual chance floodplain and floodway and the 0.2% (500-year) annual chance floodplain have been revised to reflect the updated hydrologic and hydraulic analyses along the Clinton River North Branch, the Clinton River Middle Branch, and the Miller Drain for their entire lengths within the community. The Base (1% annual chance) Flood Elevations have increased along Clinton River Middle Branch to reflect these updated hydrologic and hydraulic analyses.

FIS Report

The FIS Report, including Table 2 (Floodway Data) and Flood Profiles 07P through 13P, has been revised to reflect the aforementioned updated analyses.

PRELIMINARY
SUMMARY OF MAP ACTIONS

Community:	Township of Clinton, Michigan
Community No.:	260121
Revised Map Panels:	0005
Date Issued:	July 22, 1997
Page No.:	1 of 2

To assist your community in maintaining the Flood Insurance Rate Map (FIRM), we have summarized below the previous Letter of Map Change (LOMC) actions (i.e., Letters of Map Revision (LOMRs) and Letters of Map Amendment (LOMAs)) that will be affected by the preparation of the enclosed revised FIRM panels.

1. LOMRs and LOMAs Incorporated

The LOMRs and LOMAs listed below have been incorporated into and are reflected on the preliminary FIRM. However, until the revised FIRM becomes effective, the LOMRs and LOMAs will remain in effect.

LOMC	Case No.	Date Issued	Project Identifier	New Panel	New Zone
LOMR-F	93-05-664A	April 20, 1993	Knollwood Pointe Condos	0005	
LOMR	95-05-252P	March 20, 1995	Diamond Pointe Condos	0005	
LOMR-F	93-05-108A	December 17, 1993	Part of the NE 1/2 of Section 8, Town 2 North, Range 13 East - Hidden Brook Farm	0005	

2. LOMRs and LOMAs Not Incorporated

The LOMRs and LOMAs listed below have not been reflected on the preliminary FIRM. This is either due to scale limitations of the FIRM, or because the LOMR or LOMA issued determined that the lots or structures involved are out of the Special Flood Hazard Area, as shown on the FIRM. These LOMRs and LOMAs will be revalidated free of charge the day after the revised map panels become effective.

LOMC	Case No.	Date Issued	Project Identifier	New Panel	New Zone
LOMR-F	97-05-1936A	May 15, 1997	Pebble Point Condominiums Parcel SW 1/4, Section 19	0005	
LOMA	97-05-2120A	March 14, 1997	Steeplechase Condos No. 2 - Lot 80 - 15911 Arabian Court	0005	
BADL	93-05-077P	January 9, 1993	Groth Drain - Knollwood Pointe Condos	0005	
LOMA	94-05-0142W	April 28, 1994	Lot 16, Shangri-La subdivision - 35600 Shangri-La	0010	

3. LOMRs and LOMAs Superseded

The LOMRs and LOMAs listed below have not been reflected on the preliminary FIRM because they have been superseded by new detailed flooding data. When the revised FIRM becomes effective, these LOMRs and LOMAs will no longer be in force.

LOMC	Case No.	Date Issued	Project Identifier	New Panel	New Zone
LOMR-F	96-05-2730A	August 23, 1996	Lot 397 - North Branch Valley subdivision No. 6 - 42916 Biland Drive	0005	
LOMA	97-05-088A	November 12, 1996	Lot 559 - North Branch Valley subdivision No. 8 - 20864 Moyer Drive	0005	
LOMA	96-05-3438A	December 5, 1996	Rivergate Farms subdivision	0005	
LOMA	96-05-1984A	April 15, 1996	20140 Cass Avenue	0005	
LOMA	96-05-3004A	October 3, 1996	43269 Brooks Drive	0005	
LOMA	97-05-2410A	June 12, 1997	Lot 143 - Rivergate subdivision 44373 Thunder Bay	0005	
LOMA	96-05-3440A	November 8, 1996	Lots 28-32, portions of Lots 1-21 Rivergate Woods subdivision	0005	
LOMA	93-05-0194W	August 25, 1993	42733 Heydenreich Road	0005

PRELIMINARY

JUL 22 1997

REVISED:

Federal Emergency Management Agency

COMMUNITY NUMBER - 260121

NOTICE TO
FLOOD INSURANCE STUDY USERS

Communities participating in the National Flood Insurance Program have established repositories of flood hazard data for floodplain management and flood insurance purposes. This Flood Insurance Study (FIS) may not contain all data available within the repository. It is advisable to contact the community repository for any additional data.

Part or all of this FIS may be revised and republished at any time. In addition, part of this FIS may be revised by the Letter of Map Revision process, which does not involve republication or redistribution of the FIS. It is, therefore, the responsibility of the user to consult with community officials and to check the community repository to obtain the most current FIS components.

FIS Effective Date:

Revised FIS Dates:

This preliminary FIS report does not include unrevised Floodway Data Tables or unrevised Flood Profiles. These Floodway Data Tables and Flood Profiles will appear in the final FIS report.

TABLE OF CONTENTS

1 0 INTRODUCTION

1 1 Purpose of Study

This Flood Insurance Study (FIS) revises and updates a previous FIS/Flood Insurance Rate Map (FIRM) for the Township of Clinton, Macomb County, Michigan This information will be used by the Township of Clinton to update existing floodplain regulations as part of the Regular Phase of the National Flood Insurance Program (NFIP). The information will also be used by local and regional planners to further promote sound land use and floodplain development

In some States or communities, floodplain management criteria or regulations may exist that are more restrictive or comprehensive than the minimum Federal requirements In such cases, the more restrictive criteria take precedence and the State (or other jurisdictional agency) will be able to explain them.

1 2 Authority and Acknowledgments

The sources of authority for this FIS are the National Flood Insurance Act of 1968 and the Flood Disaster Protection Act of 1973

For the original, February 1979 FIS, and the August 1, 1979, FIRM (hereinafter referred to as the 1979 FIS), the hydrologic and hydraulic analyses were prepared by Johnson and Anderson, Inc., for the Federal Insurance Administration (FIA), under Contract No H-3969 This work was completed in November 1977

For the January 2, 1992, FIS, the hydrologic and hydraulic analyses were prepared by the U S. Army Corps of Engineers (USACE), Detroit District, for the Federal Emergency Management Agency (FEMA), under Inter-Agency Agreement No EMW-89-E-2994, Project Order No. 4

For this revision, the hydrologic and hydraulic analyses for the township were prepared by STS Consultants, Ltd., for FEMA, under Contract No EMW-91-C-3361 This work was completed in July 1994

The digital base map files were provided by the State of Michigan, Department of Natural Resources, P O Box 30028, Lansing, Michigan 48909 These files were compiled by the Department of Natural Resources at a scale of 1 24,000 from U.S Geological Survey (USGS) 7 5 Minute Topographic Maps on a stable base and updated using aerial photographs Additional information was added in and around the floodplains from the previously compiled FIS for the Township of Clinton. The digital FIRM was produced in Universal Transverse Mercator coordinates referenced to the North American Datum of 1927 and the Clarke 1866 spheroid

1.3 Coordination

The purpose of an initial Consultation Coordination Officer's (CCO) meeting is to discuss the scope of the FIS. A final CCO meeting is held to review the results of the study.

For the 1979 FIS, an initial CCO meeting was held in March 1976, and a final CCO meeting was held on September 20, 1978. Both of these meetings were attended by representatives of the township, the Michigan Department of Natural Resources, Johnson and Anderson, Inc., and the FIA.

For this revision, the Township of Clinton was notified by FEMA in a letter dated January 9, 1997, that its FIS would be revised using the analyses prepared by STS Consultants, Ltd.

2.0 AREA STUDIED

2.1 Scope of Study

This FIS covers the incorporated area of the Township of Clinton, Macomb County, Michigan. The area of study is shown on the Vicinity Map (Figure 1).

For the 1979 FIS, the following streams were studied by detailed methods: the Clinton River, the Clinton River Spillway, Clinton River North Branch, Clinton River Middle Branch, Miller Drain, Harrington Drain, and Red Run Drain.

For the January 2, 1992, FIS, the Clinton River and Red Run Drain were restudied in detail.

For this revision, the following streams were restudied by detailed methods: Miller Drain, Clinton River Middle Branch, and Clinton River North Branch for their entire lengths within the community.

All or portions of the following flooding sources were studied by approximate methods: Crooked Brook Drain, Daus Drain, Groth Drain, Kenner Drain, Teak Drain, Utica Drain, and several unnamed tributaries. Approximate analyses were used to study those areas having a low development potential or minimal flood hazards. The scope and methods of study were proposed to, and agreed upon by, FEMA and the Township of Clinton.

This revision incorporates the determination of a Letter of Map Revision (LOMR) issued by FEMA, dated March 20, 1995, to reflect the existance of an 84-inch culvert and placement of fill along Crooked Brook Drain in the vicinity of Diamond Pointe Cluster Homes.

This revision also incorporates the determinations of LOMRs based on fill issued by FEMA, dated April 20, 1993, to reflect the increased elevation by placement of fill of property along Groth Drain on Pointe Drive, Pointe Circle, and Pointe Court, known as Knollwood Condominiums; and dated December 17, 1993, to reflect the elevation by placement of fill of property along an unnamed tributary to the Clinton River Middle Branch, described as "Part of the NE ½ of Section 8, Town 2 North, Range 13 East."

2.2 Community Description

The Township of Clinton is located in southern Macomb County, which is in the southeastern portion of Michigan's lower peninsula. The communities of Fraser, Roseville, and St. Clair Shores bound Clinton on the south. On the west, north, and east, Clinton is bounded by the City of Sterling Heights, the Township of Macomb, and the Township of Harrison, respectively. Clinton is also bordered on the east by the City of Mount Clemens. Portions of Clinton are within six miles northeast of the City of Detroit. The population of Clinton was 26,688 in 1960, increasing to 48,865 in 1970. The 1994 population was estimated at 63,000.

The development of Clinton consists primarily of medium density housing in the form of large subdivisions and apartment complexes. Commercial development is typically restricted to strip areas along major highways and regional shopping centers.

The climate of the township is affected by the proximity of the Great Lakes, which act to modify temperature extremes throughout the year. The maximum monthly average of 72 degrees Fahrenheit (°F) occurs in July, and the minimum monthly average of 24°F occurs in January. The average annual precipitation of 28 inches includes approximately 30 inches of snow.

Clinton is located in an area of fairly level topography, consisting primarily of post-glacial lake beds and glacial moraines. The soils of the Clinton River basin are generally clays, mixed with varying amounts of sand and gravel.

Except for the limited areas on the southeast and extreme northeast side of Clinton, all streams within the township are part of the Clinton River basin. The Clinton River flows from the western township boundary in a northeasterly direction to a place known as the Forks Area (the point where the Clinton River, Middle Branch, and North Branch come together within a short distance), located less than a mile west of the Mount Clemens city limits. It then flows in a southeasterly direction through portions of both Clinton and Mount Clemens. Near the boundary between south-central Mount Clemens and Clinton, the Clinton River turns north for about a mile then east, flowing through another part of the City of Mount Clemens, then again through Clinton to its point of exit from the township. The Clinton River Spillway flows in a southeasterly direction from the point where the Clinton River turns north to its point of exit from Clinton. In a west to east order, Clinton River Middle Branch, Miller Drain, and Clinton River North Branch enter Clinton from the north flowing to the Forks Areas in a southeasterly, southerly, and south-southeasterly direction, respectively. Harrington Drain flows from the City of Fraser on the southwest side of Clinton in a northeasterly direction to its confluence with the Clinton River, near the city limits of Mount Clemens. The Red Run Drain flows for only a limited distance in the Township of Clinton from the corporate boundary on the west to its confluence with the Clinton River.

With the exception of the Clinton River Spillway, floodplain development has occurred to a minor extent along all of the streams studied in detail. Some flooding from a 100-year event is projected for scattered residential areas throughout the township. In a number of areas, the flooding will be confined to the yards of residential areas. The three most developed areas expected to flood include areas adjacent to the south and east sides of the Forks Area, downstream of Garfield Road for approximately 2,000 feet along the north bank of the Clinton River and downstream of Hayes Road for approximately 4,000 feet along the north bank of the Clinton River.

The increased runoff and, therefore, peak flows, for the Clinton River Middle Branch, specifically in Shelby and Washington Townships, is probably a result of a population increase of 71-percent for the watershed.

2.3 Principal Flood Problems

Some local flooding has occurred in areas within the Clinton River basin due to inadequate storm drainage. This type of flooding is usually experienced during the late winter and early spring, primarily due to snowmelt or rainfall on frozen or saturated ground. On the other hand, some floods have been a result of localized, intense rainfall during the summer.

Large magnitude floods have occurred within the Clinton River basin several times since the beginning of this century. Although the greatest observed flood occurred in 1902, the greatest flood of record occurred in April 1947. Other significant floods of less magnitude occurred in June 1905, August 1914, February 1922, February 1938, May 1943, May 1948, April 1956, and June 1968. The major floods of record are tabulated below and compared with the 10- and 100-year floods in this report. Photographs of the July 1967 flood and the June 1968 flood are shown in Figures 2 and 3.

Year	Flow at Mount Clemens Gage Located at Moravian Drive cubic feet per second (cfs)	Observed Gage Height feet
1947	21,200	23.55
1943	17,700	21.89
1968	14,600	18.30
1938	13,900	20.70
1948	13,500	19.89
1956	13,400	17.74
100-Year	21,300	21.71
10-Year	12,600	17.23

2.4 Flood Protection Measures

The principal flood protection measure has been the construction of the Clinton River Spillway. During flood flow, it is estimated that better than 65 percent of the Clinton River discharge passes down the Clinton River Spillway instead of following the original channel. The spillway, 2.1 miles long, bypasses the last 8.7 miles of the river during high river stages and empties directly into Lake St. Clair.

On Red Run Drain, a number of changes have been made outside the study limits which would affect flood flows. A discussion of these changes can be found in the Flood Insurance Study for the City of Warren (Reference 1). The most substantial change near and in Clinton is the improvement of the channel hydraulic characteristics of Red Run Drain. Near Clinton, the improvements completed in 1954 included a trapezoidal channel with one vertical and two horizontal side slopes and a bottom width of 100 to 125 feet.

For Harrington Drain, outside of the study limits, several measures have been taken to reduce flood hazards. These include a reduction in drainage area, the addition of a lift station at a reservoir in the City of Fraser, and a new pressure main to the Sweeney Drain

3.0 ENGINEERING METHODS

For the flooding sources studied in detail in the community, standard hydrologic and hydraulic study methods were used to determine the flood hazard data required for this study. Flood events of a magnitude which are expected to be equaled or exceeded once on the average during any 10-, 50-, 100-, or 500-year period (recurrence interval) have been selected as having special significance for floodplain management and for flood insurance rates. These events, commonly termed the 10-, 50-, 100-, and 500-year floods, have a 10, 2, 1, and 0.2 percent chance, respectively, of being equaled or exceeded during any year. Although the recurrence interval represents the long term average period between floods of a specific magnitude, rare floods could occur at short intervals or even within the same year. The risk of experiencing a rare flood increases when periods greater than 1 year are considered. For example, the risk of having a flood which equals or exceeds the 100-year flood (1 percent chance of annual exceedence) in any 50-year period is approximately 40 percent (4 in 10), and, for any 90-year period, the risk increases to approximately 60 percent (6 in 10). The analyses reported herein reflect flooding potentials based on conditions existing in the community at the time of completion of this study. Maps and flood elevations will be amended periodically to reflect future changes.

3.1 Hydrologic Analyses

Hydrologic analyses were carried out to establish the peak discharge-frequency relationships for floods of the selected recurrence intervals for each stream studied in detail in the community.

For the 1979 FIS, the frequency discharge data were computed using the Unit Hydrograph Infiltrating Capacity Method developed by Dr. Ernest F. Brater (Reference 2). This method utilizes relationships of streamflow, drainage area, and population density. Urbanization and channel conditions were considered for 1976 conditions. As urbanization affects imperviousness and channel conditions, flows can be expected to increase. Two other methods, a log-Pearson Type III gage analysis and the Soil Conservation Service (SCS) flood routing techniques, were used in conjunction with the Brater method (References 3 and 4).

The following gages were used for the log-Pearson Type III analysis: The Fraser Gage on the Clinton River 800 feet downstream of Garfield Road, from 1947 to present; the Mount Clemens Gage on the Clinton River 20 feet downstream of Moravian Drive, from 1934 to present; the gage near Mount Clemens on the Clinton River North Branch 30 feet upstream from Michigan Highway 59 (M-59), from 1947 to present; and the gage at Macomb on the Clinton River Middle Branch just downstream of Romeo Plank Road, 1959 to present.

For the January 2, 1992, revision, gage analyses of the Clinton River were performed using the USACE HEC-WRC computer program (Reference 5). Peak discharges along Red Run Drain were obtained from the FIS for the City of Sterling Heights, Michigan (Reference 6).

For this revision of Miller Drain and the Middle and North Branches of the Clinton River, the 10-, 50-, 100-, and 500-year flood events were simulated using the HEC-2 computer model. The existing North Branch gage No. 04164500 (approximately 30 feet upstream of the upstream study limit) data was extended using flows at the downstream gage No. 04165500 in the City of Mt. Clemens.

A summary of the drainage area-peak discharge relationships for the streams studied by detailed methods is shown in Table 1, "Summary of Discharges."

TABLE 1 - SUMMARY OF DISCHARGES

FLOODING SOURCE AND LOCATION	DRAINAGE AREA (sq. miles)	PEAK DISCHARGES (cfs)			
		10-YEAR	50-YEAR	100-YEAR	500-YEAR
CLINTON RIVER					
Just downstream of Clinton River Spillway	N/A	3,600	5,900	6,800	10,000

Just upstream of Vermander Drive	4.35	720	1,120	1,180	1,660
Just upstream of Teske Drive	3.18	560	800	920	1,300
Just upstream of Sweeney Drain	1.40	380	540	620	870

3.2 Hydraulic Analyses

Analyses of the hydraulic characteristics of flooding from the sources studied were carried out to provide estimates of the elevations of floods of the selected recurrence intervals.

Two detailed cross sections of Miller Drain, Middle and North Branches of the Clinton River utilized topographic aerial maps at a scale of 1"=400', with a contour interval of 2 feet (Reference 7). All other cross sections for the flooding sources studied by detailed methods were obtained from field surveys. All bridges, dams, and culverts were field surveyed to obtain elevation data and structural geometry.

Locations of selected cross sections used in the hydraulic analyses are shown on the Flood Profiles (Exhibit 1). For stream segments for which a floodway was computed (Section 4.2), selected cross-section locations are also shown on the FIRM (Exhibit 2).

Water-surface elevations of floods of the selected recurrence intervals were computed using the USACE HEC-2 step-backwater computer program (Reference 8). Starting water-surface elevations were calculated using the backwater curves started at Lake St. Clair and carried on up to the mouth of each stream. From the profiles, stage discharge curves were established at the mouth of each stream. Flood profiles were drawn showing computed water-surface elevations for floods of the selected recurrence intervals.

Roughness factors (Manning's "n") used in the hydraulic computations were based on conditions in the watersheds typical of those for the projected flood season and were chosen by engineering judgment. The following tabulation shows the channel and overbank "n" values for the streams studied by detailed methods:

Stream	Channel "n"	Overbank "n"
Clinton River	0.025-0.055	0.020-0.120
Red Run Drain	0.025-0.055	0.020-0.120
Clinton River Spillway	0.025-0.055	0.020-0.120
Clinton River North Branch	0.030-0.080	0.040-0.100
Clinton River Middle Branch	0.020-0.070	0.040-0.090
Miller Drain	0.045-0.068	0.040-0.100
Harrington Drain	0.025-0.055	0 020-0.120

The hydraulic analyses for this study were based on unobstructed flow The flood elevations shown on the profiles are thus considered valid only if hydraulic structures remain unobstructed, operate properly, and do not fail.

In areas studied by approximate methods, the 100-year flood was determined by either extending the flow-stream depth relationship determined in the detailed study area: relating flow, area, and depth to a similar one studied by detailed methods: or by using a Map of Flood Prone Areas (Reference 9).

All elevations are referenced to the National Geodetic Vertical Datum of 1929 (NGVD). Elevation reference marks used in this study, and their descriptions, are shown on the FIRMs.

4.0 FLOODPLAIN MANAGEMENT APPLICATIONS

The NFIP encourages State and local governments to adopt sound floodplain management programs. Therefore, each FIS generally provides 100-year flood elevations and delineations of the 100- and 500-year floodplain boundaries and 100-year floodway to assist in developing floodplain management measures.

4.1 Floodplain Boundaries

To provide a national standard without regional discrimination, the 1-percent annual chance (100-year) flood has been adopted by FEMA as the base flood for floodplain management purposes. The 0.2-percent annual chance (500-year) flood is employed to indicate additional areas of flood risk in the community. For the streams studied in detail, the 100- and 500-year floodplains have been delineated using the flood elevations determined at each cross section.

In the 1979 FIS, and for the January 2, 1992, revision, the boundaries were interpolated between cross sections using photogrammetric methods and topographic maps at scales of 1:9,600 and 1:24,000 with contour intervals of 2 feet and 5 feet, respectively (References 7 and 9).

For this revision, the boundaries were interpolated between cross sections, using topographic maps at a scale of 1:9,600 with a contour interval of 2 feet (Reference 7).

For the streams studied by approximate methods, the 100-year floodplain boundaries were taken from the previously printed FIS/FIRM for the Township of Clinton (Reference 10).

The 100- and 500-year floodplain boundaries are shown on the FIRM (Exhibit 2). On this map, the 100-year floodplain boundary corresponds to the boundary of the areas of special flood hazards (Zones A and AE), and the 500-year floodplain boundary corresponds to the boundary of areas of moderate flood hazards. In cases where the 100- and 500-year floodplain boundaries are close together, only the 100-year floodplain boundary has been shown. Small areas within the floodplain boundaries may lie above the flood elevations but cannot be shown due to limitations of the map scale and/or lack of detailed topographic data.

For the streams studied by approximate methods, only the 100-year floodplain boundary is shown on the FIRM (Exhibit 2).

4.2 Floodways

Encroachment on floodplains, such as structures and fill, reduces flood-carrying capacity, increases flood heights and velocities, and increases flood hazards in areas beyond the encroachment itself. One aspect of floodplain management involves balancing the economic gain from floodplain development against the resulting increase in flood hazard. For purposes of the NFIP, a floodway is used as a tool to assist local communities in this aspect of floodplain management. Under this concept, the area of the 100-year floodplain is divided into a floodway and a floodway fringe. The floodway is the channel of a stream, plus any adjacent floodplain areas, that must be kept free of encroachment so that the 100-year flood can be carried without substantial increases in flood heights. Minimum Federal standards limit such increases to 1.0 foot, provided that hazardous velocities are not produced. The floodways in this study are presented to local agencies as a minimum standard that can be adopted directly or that can be used as a basis for additional floodway studies.

The floodways presented in this study were computed for certain stream segments on the basis of equal conveyance reduction from each side of the floodplain. Floodway widths were computed at cross sections. Between cross sections, the floodway boundaries were interpolated. The results of the floodway computations are tabulated for selected cross sections (Table 2) The computed floodway is shown on the FIRM (Exhibit 2). In cases where the floodway and 100-year floodplain boundaries are either close together or collinear, only the floodway boundary is shown. Portions of the floodway for the Clinton River, the Clinton River Spillway, and Red Run Drain extend beyond the corporate limits.

Encroachment into areas subject to inundation by floodwaters having hazardous velocities aggravates the risk of flood damage, and heightens potential flood hazards by

FLOODWAY DATA

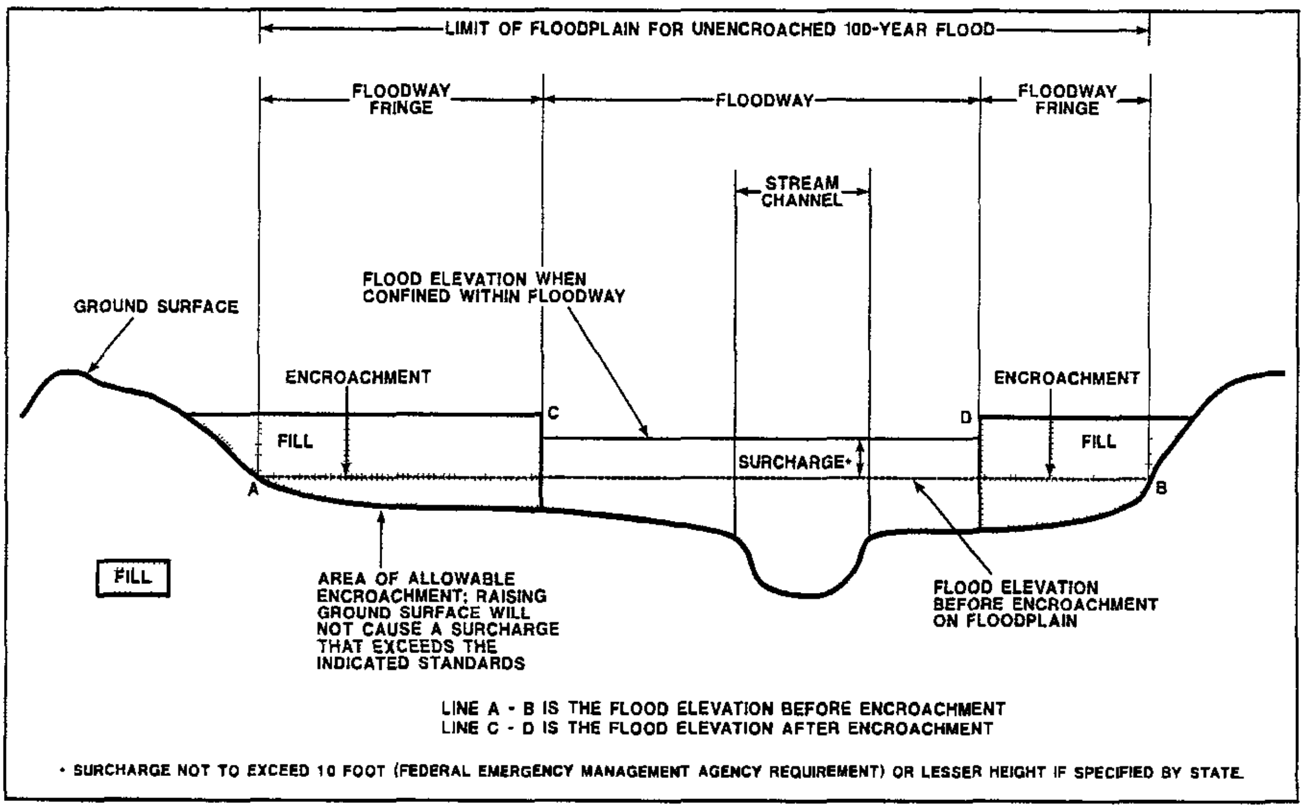
HARRINGTON DRAIN - MILLER DRAIN

further increasing velocities. A listing of stream velocities at selected cross sections is provided in Table 2, "Floodway Data." To reduce the risk of property damage in areas where the stream velocities are high, the community may wish to restrict development in areas outside the floodway.

Near the mouths of streams studied in detail, floodway computations are made without regard to flood elevations on the receiving water body. Therefore, "Without Floodway" elevations presented in Table 2 for certain downstream cross sections of the Clinton River Middle Branch, Harrington Drain, and Miller Drain are lower than the regulatory flood elevations in that area, which must take into account the 100-year flooding due to backwater from other sources.

The area between the floodway and 100-year floodplain boundaries is termed the floodway fringe. The floodway fringe encompasses the portion of the floodplain that could be completely obstructed without increasing the water-surface elevation of the 100-year flood by more than 1.0 foot at any point. Typical relationships between the floodway and the floodway fringe and their significance to floodplain development are shown in Figure 4.



FLOODWAY SCHEMATIC Figure 4

5.0 INSURANCE APPLICATIONS

For flood insurance rating purposes, flood insurance zone designations are assigned to a community based on the results of the engineering analyses. The zones are as follows:

Zone A

Zone A is the flood insurance rate zone that corresponds to the 100-year floodplains that are determined in the FIS by approximate methods. Because detailed hydraulic analyses are not performed for such areas, no base flood elevations or depths are shown within this zone.

Zone AE

Zone AE is the flood insurance rate zone that corresponds to the 100-year floodplains that are determined in the FIS by detailed methods. In most instances, whole-foot base flood elevations derived from the detailed hydraulic analyses are shown at selected intervals within this zone.

Zone AH

Zone AH is the flood insurance rate zone that corresponds to the areas of 100-year shallow flooding (usually areas of ponding) where average depths are between 1 and 3 feet. Whole-foot base flood elevations derived from the detailed hydraulic analyses are shown at selected intervals within this zone.

Zone AO

Zone AO is the flood insurance rate zone that corresponds to the areas of 100-year shallow flooding (usually sheet flow on sloping terrain) where average depths are between 1 and 3 feet. Average whole-depths derived from the detailed hydraulic analyses are shown within this zone.

Zone A99

Zone A99 is the flood insurance rate zone that corresponds to areas of the 100-year floodplain that will be protected by a Federal flood protection system where construction has reached specified statutory milestones. No base flood elevations or depths are shown within this zone.

Zone V

Zone V is the flood insurance rate zone that corresponds to the 100-year coastal floodplains that have additional hazards associated with storm waves. Because approximate hydraulic analyses are performed for such areas, no base flood elevations are shown within this zone.

Zone VE

Zone VE is the flood insurance rate zone that corresponds to the 100-year coastal floodplains that have additional hazards associated with storm waves. Whole-foot base flood elevations derived from the detailed hydraulic analyses are shown at selected intervals within this zone.

Zone X

Zone X is the flood insurance rate zone that corresponds to areas outside the 500-year floodplain, areas within the 500-year floodplain, and to areas of 100-year flooding where average depths are less than 1 foot, areas of 100-year flooding where the contributing drainage area is less than 1 square mile, and areas protected from the 100-year flood by levees. No base flood elevations or depths are shown within this zone.

Zone D

Zone D is the flood insurance rate zone that corresponds to unstudied areas where flood hazards are undetermined, but possible.

6.0 FLOOD INSURANCE RATE MAP

The FIRM is designed for flood insurance and floodplain management applications.

For flood insurance applications, the map designates flood insurance rate zones as described in Section 5.0 and, in the 100-year floodplains that were studied by detailed methods, shows selected whole-foot base flood elevations or average depths. Insurance agents use the zones and base flood elevations in conjunction with information on structures and their contents to assign premium rates for flood insurance policies.

For floodplain management applications, the map shows by tints, screens, and symbols, the 100- and 500-year floodplains. Floodways and the locations of selected cross sections used in the hydraulic analyses and floodway computations are shown where applicable.

7.0 OTHER STUDIES

FISs have been prepared for the Cities of Fraser, Mt. Clemens, Roseville, St. Clair Shores, Sterling Heights, Warren, and the Townships of Harrison and Macomb (References 11, 12, 13, 14, 6, 1, 15, and 16).

Because it is based on more up-to-date analyses, this FIS supersedes the previously printed FIS for the Township of Clinton (Reference 10).

8.0 LOCATION OF DATA

Information concerning the pertinent data used in the preparation of this study can be obtained by contacting FEMA, Mitigation Division, 175 West Jackson Boulevard, Fourth Floor, Chicago, Illinois 60604.

ENVIRONMENTAL QUALITY
LAND & WATER MANAGEMENT

Mr. James Sinnamon
Clinton Township Supervisor
Macomb County
40700 Romeo Plank Road
Clinton Township, Michigan 48038

Dear Mr. Sinnamon:

Please find enclosed two preliminary copies of the revised areas of the Flood Insurance Study (FIS) and Flood Insurance Rate Map (FIRM) for the Township of Clinton, Macomb County, Michigan. We have completed our technical evaluation of the available data and have incorporated the appropriate changes into the enclosed copies. A description of the changes with the corresponding affected portions of the FIS and FIRM is attached for your information and review.

Users of this FIRM should be aware that these maps have been computer generated. Once the FIS and FIRM are published in final format, the digital files containing the flood hazard data can be provided to your community for use in a computer mapping system. These files can be used in conjunction with other thematic data for floodplain management purposes, insurance determinations, and many other planning applications. In addition, your community may be eligible for additional credits under the Community Rating System if you implement your activities using digital mapping files.

The digital files containing the roads, road names, and corporate limits for Township of Clinton were obtained from STS Consultants, Ltd.

If you have any comments that might justify modifying our results, please use one copy of the enclosed map(s) to identify the area of concern and return it to us within 30 calendar days from the date of this letter. If you are in agreement with our findings, please respond with a letter stating that you have reviewed the accompanying material. If we do not receive any comments within 30 days, we will continue processing.

Following the 30-day review period, we will publish a notice of proposed Base (1% annual chance) Flood Elevation (BFE) determinations in your local newspaper. This notice will initiate a 90-day period during which your community may submit appeals or comments on the proposed BFEs reflected in the revised FIS and FIRM for your community. Following the 90-day appeal period and the resolution of any appeals, we will finalize the proposed BFEs and establish an effective date for the revised study.

If you have any questions, please contact the Director, Mitigation Division of the Federal Emergency Management Agency in Chicago, Illinois at (312) 408-5548.

Sincerely,

Frederick H. Sharrocks Jr., Chief
Hazard Identification Branch
Mitigation Directorate

TOWNSHIP OF CLINTON, MACOMB COUNTY, MICHIGAN

The Flood Insurance Study (FIS) and Flood Insurance Rate Map (FIRM) for the Township of Clinton have been revised to incorporate updated hydrologic and hydraulic analyses of the Clinton River North Branch, the Clinton River Middle Branch, and the Miller Drain. These analyses were prepared for the Federal Emergency Management Agency (FEMA) by STS Consultants, Ltd.

In addition, a previously issued Letter of Map Revision dated March 20, 1995 and previously issued Letters of Map Revision Based on Fill dated April 20, 1993 and December 17, 1993 have been added to the FIS Report and FIRM in this revision.

The following is a summary of changes to the FIRM and FIS Report:

FIRM number 260121, panels 0005 and 0010

The 1% (100-year) annual chance floodplain and floodway and the 0.2% (500-year) annual chance floodplain have been revised to reflect the updated hydrologic and hydraulic analyses along the Clinton River North Branch, the Clinton River Middle Branch, and the Miller Drain for their entire lengths within the community. The Base (1% annual chance) Flood Elevations have increased along Clinton River Middle Branch to reflect these updated hydrologic and hydraulic analyses.

FIS Report

The FIS Report, including Table 2 (Floodway Data) and Flood Profiles 07P through 13P, has been revised to reflect the aforementioned updated analyses.

PRELIMINARY
SUMMARY OF MAP ACTIONS

Community:	Township of Clinton, Michigan
Community No.:	260121
Revised Map Panels:	0005
Date Issued:	July 22, 1997
Page No.:	1 of 2

To assist your community in maintaining the Flood Insurance Rate Map (FIRM), we have summarized below the previous Letter of Map Change (LOMC) actions (i.e., Letters of Map Revision (LOMRs) and Letters of Map Amendment (LOMAs)) that will be affected by the preparation of the enclosed revised FIRM panels.

1. LOMRs and LOMAs Incorporated

The LOMRs and LOMAs listed below have been incorporated into and are reflected on the preliminary FIRM. However, until the revised FIRM becomes effective, the LOMRs and LOMAs will remain in effect.

LOMC	Case No.	Date Issued	Project Identifier	New Panel	New Zone
LOMR-F	93-05-664A	April 20, 1993	Knollwood Pointe Condos	0005	
LOMR	95-05-252P	March 20, 1995	Diamond Pointe Condos	0005	
LOMR-F	93-05-108A	December 17, 1993	Part of the NE 1/2 of Section 8, Town 2 North, Range 13 East - Hidden Brook Farm	0005	

2. LOMRs and LOMAs Not Incorporated

The LOMRs and LOMAs listed below have not been reflected on the preliminary FIRM. This is either due to scale limitations of the FIRM, or because the LOMR or LOMA issued determined that the lots or structures involved are out of the Special Flood Hazard Area, as shown on the FIRM. These LOMRs and LOMAs will be revalidated free of charge the day after the revised map panels become effective.

LOMC	Case No.	Date Issued	Project Identifier	New Panel	New Zone
LOMR-F	97-05-1936A	May 15, 1997	Pebble Point Condominiums Parcel SW 1/4, Section 19	0005	
LOMA	97-05-2120A	March 14, 1997	Steeplechase Condos No. 2 - Lot 80 - 15911 Arabian Court	0005	
BADL	93-05-077P	January 9, 1993	Groth Drain - Knollwood Pointe Condos	0005	
LOMA	94-05-0142W	April 28, 1994	Lot 16, Shangri-La subdivision - 35600 Shangri-La	0010	

3. LOMRs and LOMAs Superseded

The LOMRs and LOMAs listed below have not been reflected on the preliminary FIRM because they have been superseded by new detailed flooding data. When the revised FIRM becomes effective, these LOMRs and LOMAs will no longer be in force.

LOMC	Case No.	Date Issued	Project Identifier	New Panel	New Zone
LOMR-F	96-05-2730A	August 23, 1996	Lot 397 - North Branch Valley subdivision No. 6 - 42916 Biland Drive	0005	
LOMA	97-05-088A	November 12, 1996	Lot 559 - North Branch Valley subdivision No. 8 - 20864 Moyer Drive	0005	
LOMA	96-05-3438A	December 5, 1996	Rivergate Farms subdivision	0005	
LOMA	96-05-1984A	April 15, 1996	20140 Cass Avenue	0005	
LOMA	96-05-3004A	October 3, 1996	43269 Brooks Drive	0005	
LOMA	97-05-2410A	June 12, 1997	Lot 143 - Rivergate subdivision 44373 Thunder Bay	0005	
LOMA	96-05-3440A	November 8, 1996	Lots 28-32, portions of Lots 1-21 Rivergate Woods subdivision	0005	
LOMA	93-05-0194W	August 25, 1993	42733 Heydenreich Road	0005

REVISED:

Federal Emergency Management Agency

COMMUNITY NUMBER - 260121

NOTICE TO
FLOOD INSURANCE STUDY USERS

Communities participating in the National Flood Insurance Program have established repositories of flood hazard data for floodplain management and flood insurance purposes. This Flood Insurance Study (FIS) may not contain all data available within the repository. It is advisable to contact the community repository for any additional data.

Part or all of this FIS may be revised and republished at any time. In addition, part of this FIS may be revised by the Letter of Map Revision process, which does not involve republication or redistribution of the FIS. It is, therefore, the responsibility of the user to consult with community officials and to check the community repository to obtain the most current FIS components.

FIS Effective Date:

Revised FIS Dates:

This preliminary FIS report does not include unrevised Floodway Data Tables or unrevised Flood Profiles. These Floodway Data Tables and Flood Profiles will appear in the final FIS report.

TABLE OF CONTENTS - continued

FLOOD INSURANCE STUDY
TOWNSHIP OF CLINTON, MACOMB COUNTY, MICHIGAN

1.0 INTRODUCTION

1.1 Purpose of Study

This Flood Insurance Study (FIS) revises and updates a previous FIS/Flood Insurance Rate Map (FIRM) for the Township of Clinton, Macomb County, Michigan. This information will be used by the Township of Clinton to update existing floodplain regulations as part of the Regular Phase of the National Flood Insurance Program (NFIP). The information will also be used by local and regional planners to further promote sound land use and floodplain development.

In some States or communities, floodplain management criteria or regulations may exist that are more restrictive or comprehensive than the minimum Federal requirements. In such cases, the more restrictive criteria take precedence and the State (or other jurisdictional agency) will be able to explain them.

1.2 Authority and Acknowledgments

The sources of authority for this FIS are the National Flood Insurance Act of 1968 and the Flood Disaster Protection Act of 1973.

For the original, February 1979 FIS, and the August 1, 1979, FIRM (hereinafter referred to as the 1979 FIS), the hydrologic and hydraulic analyses were prepared by Johnson and Anderson, Inc., for the Federal Insurance Administration (FIA), under Contract No. H-3969. This work was completed in November 1977.

For the January 2, 1992, FIS, the hydrologic and hydraulic analyses were prepared by the U.S. Army Corps of Engineers (USACE), Detroit District, for the Federal Emergency Management Agency (FEMA), under Inter-Agency Agreement No. EMW-89-E-2994, Project Order No. 4.

For this revision, the hydrologic and hydraulic analyses for the township were prepared by STS Consultants, Ltd., for FEMA, under Contract No. EMW-91-C-3361. This work was completed in July 1994.

The digital base map files were provided by the State of Michigan, Department of Natural Resources, P.O. Box 30028, Lansing, Michigan 48909. These files were compiled by the Department of Natural Resources at a scale of 1:24,000 from U.S. Geological Survey (USGS) 7.5 Minute Topographic Maps on a stable base and updated using aerial photographs. Additional information was added in and around the floodplains from the previously compiled FIS for the Township of Clinton. The digital FIRM was produced in Universal Transverse Mercator coordinates referenced to the North American Datum of 1927 and the Clarke 1866 spheroid.

1.3 Coordination

The purpose of an initial Consultation Coordination Officer's (CCO) meeting is to discuss the scope of the FIS. A final CCO meeting is held to review the results of the study.

For the 1979 FIS, an initial CCO meeting was held in March 1976, and a final CCO meeting was held on September 20, 1978. Both of these meetings were attended by representatives of the township, the Michigan Department of Natural Resources, Johnson and Anderson, Inc., and the FIA.

For this revision, the Township of Clinton was notified by FEMA in a letter dated January 9, 1997, that its FIS would be revised using the analyses prepared by STS Consultants, Ltd.

2.0 AREA STUDIED

2.1 Scope of Study

This FIS covers the incorporated area of the Township of Clinton, Macomb County, Michigan. The area of study is shown on the Vicinity Map (Figure 1).

For the 1979 FIS, the following streams were studied by detailed methods: the Clinton River, the Clinton River Spillway, Clinton River North Branch, Clinton River Middle Branch, Miller Drain, Harrington Drain, and Red Run Drain.

For the January 2, 1992, FIS, the Clinton River and Red Run Drain were restudied in detail.

For this revision, the following streams were restudied by detailed methods: Miller Drain, Clinton River Middle Branch, and Clinton River North Branch for their entire lengths within the community.

All or portions of the following flooding sources were studied by approximate methods: Crooked Brook Drain, Daus Drain, Groth Drain, Kenner Drain, Teak Drain, Utica Drain, and several unnamed tributaries. Approximate analyses were used to study those areas having a low development potential or minimal flood hazards. The scope and methods of study were proposed to, and agreed upon by, FEMA and the Township of Clinton.

This revision incorporates the determination of a Letter of Map Revision (LOMR) issued by FEMA, dated March 20, 1995, to reflect the existance of an 84-inch culvert and placement of fill along Crooked Brook Drain in the vicinity of Diamond Pointe Cluster Homes.

This revision also incorporates the determinations of LOMRs based on fill issued by FEMA, dated April 20, 1993, to reflect the increased elevation by placement of fill of property along Groth Drain on Pointe Drive, Pointe Circle, and Pointe Court, known as Knollwood Condominiums; and dated December 17, 1993, to reflect the elevation by placement of fill of property along an unnamed tributary to the Clinton River Middle Branch, described as "Part of the NE ½ of Section 8, Town 2 North, Range 13 East."

2. 2 Community Description

The Township of Clinton is located in southern Macomb County, which is in the southeastern portion of Michigan's lower peninsula. The communities of Fraser, Roseville, and St. Clair Shores bound Clinton on the south. On the west, north, and east, Clinton is bounded by the City of Sterling Heights, the Township of Macomb, and the Township of Harrison, respectively. Clinton is also bordered on the east by the City of Mount Clemens. Portions of Clinton are within six miles northeast of the City of Detroit. The population of Clinton was 26,688 in 1960, increasing to 48,865 in 1970. The 1994 population was estimated at 63,000.

The development of Clinton consists primarily of medium density housing in the form of large subdivisions and apartment complexes. Commercial development is typically restricted to strip areas along major highways and regional shopping centers.

The climate of the township is affected by the proximity of the Great Lakes, which act to modify temperature extremes throughout the year. The maximum monthly average of 72 degrees Fahrenheit (°F) occurs in July, and the minimum monthly average of 24°F occurs in January. The average annual precipitation of 28 inches includes approximately 30 inches of snow.

Clinton is located in an area of fairly level topography, consisting primarily of post-glacial lake beds and glacial moraines. The soils of the Clinton River basin are generally clays, mixed with varying amounts of sand and gravel.

Except for the limited areas on the southeast and extreme northeast side of Clinton, all streams within the township are part of the Clinton River basin. The Clinton River flows from the western township boundary in a northeasterly direction to a place known as the Forks Area (the point where the Clinton River, Middle Branch, and North Branch come together within a short distance), located less than a mile west of the Mount Clemens city limits. It then flows in a southeasterly direction through portions of both Clinton and Mount Clemens. Near the boundary between south-central Mount Clemens and Clinton, the Clinton River turns north for about a mile then east, flowing through another part of the City of Mount Clemens, then again through Clinton to its point of exit from the township. The Clinton River Spillway flows in a southeasterly direction from the point where the Clinton River turns north to its point of exit from Clinton. In a west to east order, Clinton River Middle Branch, Miller Drain, and Clinton River North Branch enter Clinton from the north flowing to the Forks Areas in a southeasterly, southerly, and south-southeasterly direction, respectively. Harrington Drain flows from the City of Fraser on the southwest side of Clinton in a northeasterly direction to its confluence with the Clinton River, near the city limits of Mount Clemens. The Red Run Drain flows for only a limited distance in the Township of Clinton from the corporate boundary on the west to its confluence with the Clinton River.

With the exception of the Clinton River Spillway, floodplain development has occurred to a minor extent along all of the streams studied in detail. Some flooding from a 100-year event is projected for scattered residential areas throughout the township. In a number of areas, the flooding will be confined to the yards of residential areas. The three most developed areas expected to flood include areas adjacent to the south and east sides of the Forks Area, downstream of Garfield Road for approximately 2,000 feet along the north bank of the Clinton River and downstream of Hayes Road for approximately 4,000 feet along the north bank of the Clinton River.

The increased runoff and, therefore, peak flows, for the Clinton River Middle Branch, specifically in Shelby and Washington Townships, is probably a result of a population increase of 71-percent for the watershed.

2.3 Principal Flood Problems

Some local flooding has occurred in areas within the Clinton River basin due to inadequate storm drainage. This type of flooding is usually experienced during the late winter and early spring, primarily due to snowmelt or rainfall on frozen or saturated ground. On the other hand, some floods have been a result of localized, intense rainfall during the summer.

Large magnitude floods have occurred within the Clinton River basin several times since the beginning of this century. Although the greatest observed flood occurred in 1902, the greatest flood of record occurred in April 1947. Other significant floods of less magnitude occurred in June 1905, August 1914, February 1922, February 1938, May 1943, May 1948, April 1956, and June 1968. The major floods of record are tabulated below and compared with the 10- and 100-year floods in this report. Photographs of the July 1967 flood and the June 1968 flood are shown in Figures 2 and 3.

Year	Flow at Mount Clemens Gage Located at Moravian Drive cubic feet per second (cfs)	Observed Gage Height feet
1947	21,200	23.55
1943	17,700	21.89
1968	14,600	18.30
1938	13,900	20.70
1948	13,500	19.89
1956	13,400	17.74
100-Year	21,300	21.71
10-Year	12,600	17.23

2.4 Flood Protection Measures

The principal flood protection measure has been the construction of the Clinton River Spillway. During flood flow, it is estimated that better than 65 percent of the Clinton River discharge passes down the Clinton River Spillway instead of following the original channel. The spillway, 2.1 miles long, bypasses the last 8.7 miles of the river during high river stages and empties directly into Lake St. Clair.

On Red Run Drain, a number of changes have been made outside the study limits which would affect flood flows. A discussion of these changes can be found in the Flood Insurance Study for the City of Warren (Reference 1). The most substantial change near and in Clinton is the improvement of the channel hydraulic characteristics of Red Run Drain. Near Clinton, the improvements completed in 1954 included a trapezoidal channel with one vertical and two horizontal side slopes and a bottom width of 100 to 125 feet.

For Harrington Drain, outside of the study limits, several measures have been taken to reduce flood hazards. These include a reduction in drainage area, the addition of a lift station at a reservoir in the City of Fraser, and a new pressure main to the Sweeney Drain.

3.0 ENGINEERING METHODS

For the flooding sources studied in detail in the community, standard hydrologic and hydraulic study methods were used to determine the flood hazard data required for this study. Flood events of a magnitude which are expected to be equaled or exceeded once on the average during any 10-, 50-, 100-, or 500-year period (recurrence interval) have been selected as having special significance for floodplain management and for flood insurance rates. These events, commonly termed the 10-, 50-, 100-, and 500-year floods, have a 10, 2, 1, and 0.2 percent chance, respectively, of being equaled or exceeded during any year. Although the recurrence interval represents the long term average period between floods of a specific magnitude, rare floods could occur at short intervals or even within the same year. The risk of experiencing a rare flood increases when periods greater than 1 year are considered. For example, the risk of having a flood which equals or exceeds the 100-year flood (1 percent chance of annual exceedence) in any 50-year period is approximately 40 percent (4 in 10), and, for any 90-year period, the risk increases to approximately 60 percent (6 in 10). The analyses reported herein reflect flooding potentials based on conditions existing in the community at the time of completion of this study. Maps and flood elevations will be amended periodically to reflect future changes.

3.1 Hydrologic Analyses

Hydrologic analyses were carried out to establish the peak discharge-frequency relationships for floods of the selected recurrence intervals for each stream studied in detail in the community.

For the 1979 FIS, the frequency discharge data were computed using the Unit Hydrograph Infiltrating Capacity Method developed by Dr. Ernest F. Brater (Reference 2). This method utilizes relationships of streamflow, drainage area, and population density. Urbanization and channel conditions were considered for 1976 conditions. As urbanization affects imperviousness and channel conditions, flows can be expected to increase. Two other methods, a log-Pearson Type III gage analysis and the Soil Conservation Service (SCS) flood routing techniques, were used in conjunction with the Brater method (References 3 and 4).

The following gages were used for the log-Pearson Type III analysis: The Fraser Gage on the Clinton River 800 feet downstream of Garfield Road, from 1947 to present; the Mount Clemens Gage on the Clinton River 20 feet downstream of Moravian Drive, from 1934 to present; the gage near Mount Clemens on the Clinton River North Branch 30 feet upstream from Michigan Highway 59 (M-59), from 1947 to present; and the gage at Macomb on the Clinton River Middle Branch just downstream of Romeo Plank Road, 1959 to present.

For the January 2, 1992, revision, gage analyses of the Clinton River were performed using the USACE HEC-WRC computer program (Reference 5). Peak discharges along Red Run Drain were obtained from the FIS for the City of Sterling Heights, Michigan (Reference 6).

For this revision of Miller Drain and the Middle and North Branches of the Clinton River, the 10-, 50-, 100-, and 500-year flood events were simulated using the HEC-2 computer model. The existing North Branch gage No. 04164500 (approximately 30 feet upstream of the upstream study limit) data was extended using flows at the downstream gage No. 04165500 in the City of Mt. Clemens.

A summary of the drainage area-peak discharge relationships for the streams studied by detailed methods is shown in Table 1, "Summary of Discharges."

TABLE 1 - SUMMARY OF DISCHARGES

FLOODING SOURCE AND LOCATION	DRAINAGE AREA (sq. miles)	PEAK DISCHARGES (cfs) 10-YEAR	50-YEAR	100-YEAR	500-YEAR
CLINTON RIVER					
Just downstream of Clinton River Spillway	N/A	3,600	5,900	6,800	10,000
Moravian Drive	743	12,600	19,000	21,300	28,900
Just upstream of Clinton River North Branch	465	8,580*	13,300*	15,000*	19,800*
At Kukuk Drain	461	8,730*	13,500*	15,200*	20,000*
At Cranberry Marsh Drain	459	8,700*	13,400*	15,200*	19,900*
At Fraser Gage	458	8,830	13,600	15,400	20,200

At mouth	4.94	260	380	430	590
HARRINGTON DRAIN					
At mouth	5.95	930	1,320	1,520	2,140
Approximately 9,300 feet upstream of mouth	5.18	830	1,180	1,360	1,910
Just upstream of Vermander Drive	4.35	720	1,120	1,180	1,660
Just upstream of Teske Drive	3.18	560	800	920	1,300
Just upstream of Sweeney Drain	1.40	380	540	620	870

3.2 Hydraulic Analyses

Analyses of the hydraulic characteristics of flooding from the sources studied were carried out to provide estimates of the elevations of floods of the selected recurrence intervals.

Two detailed cross sections of Miller Drain, Middle and North Branches of the Clinton River utilized topographic aerial maps at a scale of 1"=400', with a contour interval of 2 feet (Reference 7). All other cross sections for the flooding sources studied by detailed methods were obtained from field surveys. All bridges, dams, and culverts were field surveyed to obtain elevation data and structural geometry.

Locations of selected cross sections used in the hydraulic analyses are shown on the Flood Profiles (Exhibit 1). For stream segments for which a floodway was computed (Section 4.2), selected cross-section locations are also shown on the FIRM (Exhibit 2).

Water-surface elevations of floods of the selected recurrence intervals were computed using the USACE HEC-2 step-backwater computer program (Reference 8). Starting water-surface elevations were calculated using the backwater curves started at Lake St. Clair and carried on up to the mouth of each stream. From the profiles, stage discharge curves were established at the mouth of each stream. Flood profiles were drawn showing computed water-surface elevations for floods of the selected recurrence intervals.

Roughness factors (Manning's "n") used in the hydraulic computations were based on conditions in the watersheds typical of those for the projected flood season and were chosen by engineering judgment. The following tabulation shows the channel and overbank "n" values for the streams studied by detailed methods:

Stream	Channel "n"	Overbank "n"
Clinton River	0.025-0.055	0.020-0.120
Red Run Drain	0.025-0.055	0.020-0.120
Clinton River Spillway	0.025-0.055	0.020-0.120
Clinton River North Branch	0.030-0.080	0.040-0.100
Clinton River Middle Branch	0.020-0.070	0.040-0.090
Miller Drain	0.045-0.068	0.040-0.100
Harrington Drain	0.025-0.055	0.020-0.120

The hydraulic analyses for this study were based on unobstructed flow. The flood elevations shown on the profiles are thus considered valid only if hydraulic structures remain unobstructed, operate properly, and do not fail.

In areas studied by approximate methods, the 100-year flood was determined by either extending the flow-stream depth relationship determined in the detailed study area; relating flow, area, and depth to a similar one studied by detailed methods; or by using a Map of Flood Prone Areas (Reference 9).

All elevations are referenced to the National Geodetic Vertical Datum of 1929 (NGVD). Elevation reference marks used in this study, and their descriptions, are shown on the FIRMs.

4.0 FLOODPLAIN MANAGEMENT APPLICATIONS

The NFIP encourages State and local governments to adopt sound floodplain management programs. Therefore, each FIS generally provides 100-year flood elevations and delineations of the 100- and 500-year floodplain boundaries and 100-year floodway to assist in developing floodplain management measures.

4.1 Floodplain Boundaries

To provide a national standard without regional discrimination, the 1-percent annual chance (100-year) flood has been adopted by FEMA as the base flood for floodplain management purposes. The 0.2-percent annual chance (500-year) flood is employed to indicate additional areas of flood risk in the community. For the streams studied in detail, the 100- and 500-year floodplains have been delineated using the flood elevations determined at each cross section.

In the 1979 FIS, and for the January 2, 1992, revision, the boundaries were interpolated between cross sections using photogrammetric methods and topographic maps at scales of 1:9,600 and 1:24,000 with contour intervals of 2 feet and 5 feet, respectively (References 7 and 9).

For this revision, the boundaries were interpolated between cross sections, using topographic maps at a scale of 1:9,600 with a contour interval of 2 feet (Reference 7).

For the streams studied by approximate methods, the 100-year floodplain boundaries were taken from the previously printed FIS/FIRM for the Township of Clinton (Reference 10).

The 100- and 500-year floodplain boundaries are shown on the FIRM (Exhibit 2). On this map, the 100-year floodplain boundary corresponds to the boundary of the areas of special flood hazards (Zones A and AE), and the 500-year floodplain boundary corresponds to the boundary of areas of moderate flood hazards. In cases where the 100- and 500-year floodplain boundaries are close together, only the 100-year floodplain boundary has been shown. Small areas within the floodplain boundaries may lie above the flood elevations but cannot be shown due to limitations of the map scale and/or lack of detailed topographic data.

For the streams studied by approximate methods, only the 100-year floodplain boundary is shown on the FIRM (Exhibit 2).

4.2 Floodways

Encroachment on floodplains, such as structures and fill, reduces flood-carrying capacity, increases flood heights and velocities, and increases flood hazards in areas beyond the encroachment itself. One aspect of floodplain management involves balancing the economic gain from floodplain development against the resulting increase in flood hazard. For purposes of the NFIP, a floodway is used as a tool to assist local communities in this aspect of floodplain management. Under this concept, the area of the 100-year floodplain is divided into a floodway and a floodway fringe. The floodway is the channel of a stream, plus any adjacent floodplain areas, that must be kept free of encroachment so that the 100-year flood can be carried without substantial increases in flood heights. Minimum Federal standards limit such increases to 1.0 foot, provided that hazardous velocities are not produced. The floodways in this study are presented to local agencies as a minimum standard that can be adopted directly or that can be used as a basis for additional floodway studies.

The floodways presented in this study were computed for certain stream segments on the basis of equal conveyance reduction from each side of the floodplain. Floodway widths were computed at cross sections. Between cross sections, the floodway boundaries were interpolated. The results of the floodway computations are tabulated for selected cross sections (Table 2). The computed floodway is shown on the FIRM (Exhibit 2). In cases where the floodway and 100-year floodplain boundaries are either close together or collinear, only the floodway boundary is shown. Portions of the floodway for the Clinton River, the Clinton River Spillway, and Red Run Drain extend beyond the corporate limits.

Encroachment into areas subject to inundation by floodwaters having hazardous velocities aggravates the risk of flood damage, and heightens potential flood hazards by

FLOODWAY DATA

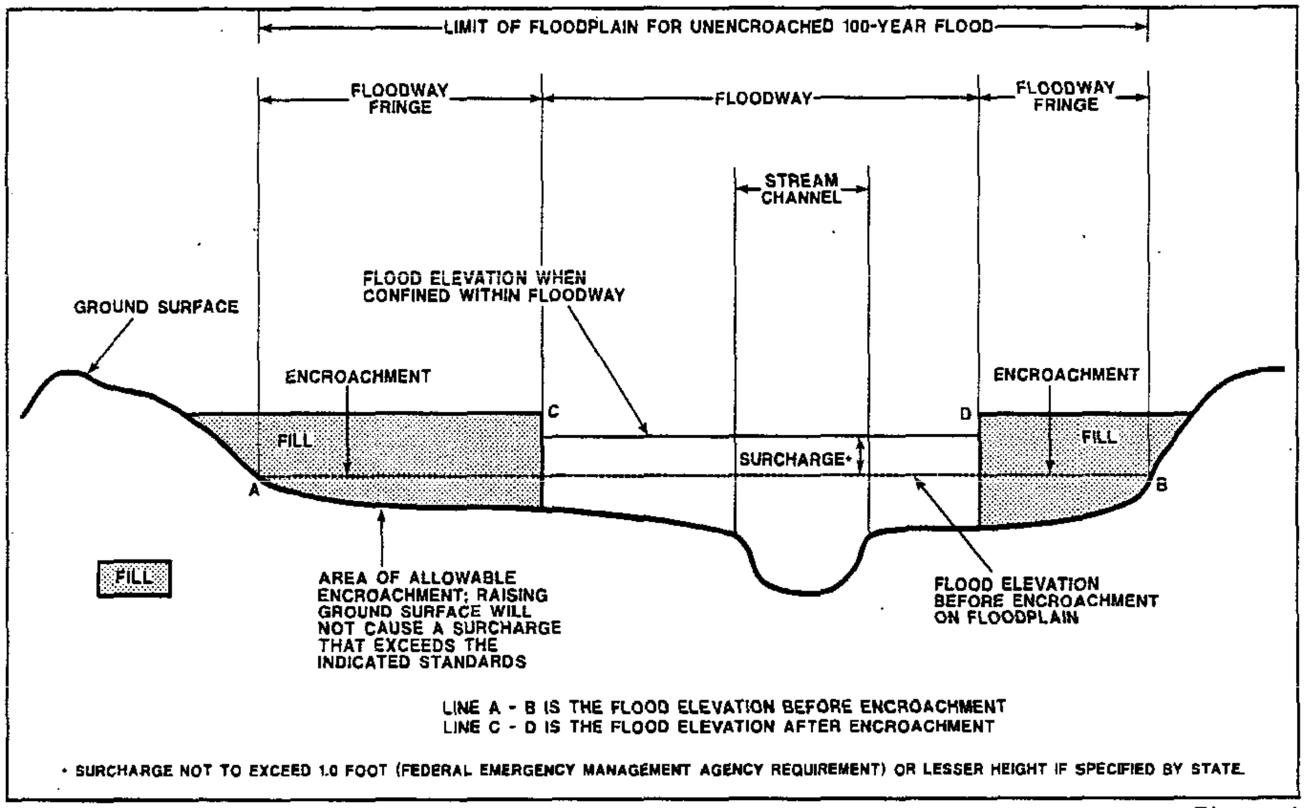
HARRINGTON DRAIN - MILLER DRAIN

further increasing velocities. A listing of stream velocities at selected cross sections is provided in Table 2, "Floodway Data." To reduce the risk of property damage in areas where the stream velocities are high, the community may wish to restrict development in areas outside the floodway.

Near the mouths of streams studied in detail, floodway computations are made without regard to flood elevations on the receiving water body. Therefore, "Without Floodway" elevations presented in Table 2 for certain downstream cross sections of the Clinton River Middle Branch, Harrington Drain, and Miller Drain are lower than the regulatory flood elevations in that area, which must take into account the 100-year flooding due to backwater from other sources.

The area between the floodway and 100-year floodplain boundaries is termed the floodway fringe. The floodway fringe encompasses the portion of the floodplain that could be completely obstructed without increasing the water-surface elevation of the 100-year flood by more than 1.0 foot at any point. Typical relationships between the floodway and the floodway fringe and their significance to floodplain development are shown in Figure 4.



FLOODWAY SCHEMATIC Figure 4

5.0 INSURANCE APPLICATIONS

For flood insurance rating purposes, flood insurance zone designations are assigned to a community based on the results of the engineering analyses. The zones are as follows:

Zone A

Zone A is the flood insurance rate zone that corresponds to the 100-year floodplains that are determined in the FIS by approximate methods. Because detailed hydraulic analyses are not performed for such areas, no base flood elevations or depths are shown within this zone.

Zone AE

Zone AE is the flood insurance rate zone that corresponds to the 100-year floodplains that are determined in the FIS by detailed methods. In most instances, whole-foot base flood elevations derived from the detailed hydraulic analyses are shown at selected intervals within this zone.

Zone AH

Zone AH is the flood insurance rate zone that corresponds to the areas of 100-year shallow flooding (usually areas of ponding) where average depths are between 1 and 3 feet. Whole-foot base flood elevations derived from the detailed hydraulic analyses are shown at selected intervals within this zone.

Zone AO

Zone AO is the flood insurance rate zone that corresponds to the areas of 100-year shallow flooding (usually sheet flow on sloping terrain) where average depths are between 1 and 3 feet. Average whole-depths derived from the detailed hydraulic analyses are shown within this zone.

Zone A99

Zone A99 is the flood insurance rate zone that corresponds to areas of the 100-year floodplain that will be protected by a Federal flood protection system where construction has reached specified statutory milestones. No base flood elevations or depths are shown within this zone.

Zone V

Zone V is the flood insurance rate zone that corresponds to the 100-year coastal floodplains that have additional hazards associated with storm waves. Because approximate hydraulic analyses are performed for such areas, no base flood elevations are shown within this zone.

Zone VE

Zone VE is the flood insurance rate zone that corresponds to the 100-year coastal floodplains that have additional hazards associated with storm waves. Whole-foot base flood elevations derived from the detailed hydraulic analyses are shown at selected intervals within this zone.

Zone X

Zone X is the flood insurance rate zone that corresponds to areas outside the 500-year floodplain, areas within the 500-year floodplain, and to areas of 100-year flooding where average depths are less than 1 foot, areas of 100-year flooding where the contributing drainage area is less than 1 square mile, and areas protected from the 100-year flood by levees. No base flood elevations or depths are shown within this zone.

Zone D

Zone D is the flood insurance rate zone that corresponds to unstudied areas where flood hazards are undetermined, but possible.

6.0 FLOOD INSURANCE RATE MAP

The FIRM is designed for flood insurance and floodplain management applications.

For flood insurance applications, the map designates flood insurance rate zones as described in Section 5.0 and, in the 100-year floodplains that were studied by detailed methods, shows selected whole-foot base flood elevations or average depths. Insurance agents use the zones and base flood elevations in conjunction with information on structures and their contents to assign premium rates for flood insurance policies.

For floodplain management applications, the map shows by tints, screens, and symbols, the 100- and 500-year floodplains. Floodways and the locations of selected cross sections used in the hydraulic analyses and floodway computations are shown where applicable.

7.0 OTHER STUDIES

FISs have been prepared for the Cities of Fraser, Mt. Clemens, Roseville, St. Clair Shores, Sterling Heights, Warren, and the Townships of Harrison and Macomb (References 11, 12, 13, 14, 6, 1, 15, and 16).

Because it is based on more up-to-date analyses, this FIS supersedes the previously printed FIS for the Township of Clinton (Reference 10).

8.0 LOCATION OF DATA

Information concerning the pertinent data used in the preparation of this study can be obtained by contacting FEMA, Mitigation Division, 175 West Jackson Boulevard, Fourth Floor, Chicago, Illinois 60604.

RE: Clinton Township Flood Insurance Study
Hydraulic Analyses Report

Dear Mr. Menerey:

Enclosed is the Hydraulic Analyses Report for the Clinton Township Flood Insurance Study (FIS). Clinton Township is located in Macomb County, Michigan. This report was generated for the Federal Emergency Management Agency (FEMA) as part of the National Flood Insurance Program (Contract No. EMW-91-C-3361).

The enclosed report summarizes the technical analyses which were performed to assess flooding conditions in Clinton Township. These analyses included the estimation of flood plain elevations and limits, and floodway location for the Miller Drain, and Middle Branch and North Branch of the Clinton River.

Your review of this report is requested Upon receipt of approval of the results presented in this report, STS will proceed with finalizing the FIS for Clinton Township. If you have any questions regarding the enclosed report, please contact us at (517) 321-4964.

Sincerely,

STS CONSULTANTS, LTD.

TABLE OF CONTENTS

Clinton Township Flood Insurance Study
Final Hydraulic Analyses Report

1.0 INTRODUCTION

The Clinton Township Flood Insurance Study (FIS) is being performed for the Federal Emergency Management Agency (FEMA) as part of the National Flood Insurance Program. Clinton Township is located in Macomb County, Michigan and a vicinity map is presented as Figure 1. The location of Clinton Township within Macomb County is presented in Figure 2. The detailed technical studies performed for the FIS were completed in two steps. The Hydrologic Analyses Report was the first step, and is preceded by this Hydraulic Analyses Report. This report provides a re-analysis of a previously completed study.

The objective of the hydraulic analysis phase of the project was to develop floodway and flood plain limits and elevations for the stream systems designated for detailed study. The scope of this study includes the performance of hydraulic analyses for the following:

1. Miller Drain — The mouth of the Miller Drain is confluent with the Middle Branch of the Clinton River and will be studied from the confluence upstream approximately 1.9 miles to the corporate limits.

2. Middle Branch — The mouth of the Middle Branch of the Clinton River is confluent with the North Branch of the Clinton River and will be studied from the confluence approximately 3.0 miles upstream to the corporate limits.

3. North Branch — The mouth of North Branch of the Clinton River is confluent with the Clinton River and will be studied from the confluence approximately 3.2 miles upstream to the corporate limits.

The locations of these watercourses within Clinton Township are illustrated in Figure 1. The peak flows developed from the hydrologic analysis were used during the hydraulic analysis of the project. Except for the Middle Branch, this study utilized the same flows as the original study of 1979.

2.0 HYDRAULIC ANALYSIS

2.1 General

Flood insurance studies were initially performed in 1979 for Clinton Township. A new flood insurance study was originally re-evaluated by STS due to the following changes in the hydraulic of the Miller Drain, Middle Branch and North Branch.

1) Reconstructed Heydenreich Road Bridges over the Miller Drain and the Middle Branch.

2) New channel configuration on the upstream portion of the Miller Drain.

After STS initiated the study, it was learned that the Little Road Bridge was removed and this change was then incorporated into the study. The hydrology has also been re-evaluated and approved by the Michigan Department of Natural Resources, Land and Water Management Division by a letter dated December 17, 1993. A summary of the MDNR approved hydrologic analysis discharges are presented in Table 1.

2.2 Methodology

The Army Corps of Engineers' HEC-2 computer model *(Reference 1)* was utilized to simulate the 10-, 50-, 100- and 500-year flood events and to estimate water surface elevations. This program simulates water surface profiles for steady, gradually varied flow in natural or manmade channels based on the solution of the one-dimensional energy equation. Energy losses due to friction are evaluated using Manning's Equation *(Reference 2)*. The program has the capability to assess the impacts of various obstructions to flow, including bridges, culverts and weirs. The computational procedure utilized by the program is generally known as the standard step method. Parameters that were input to the HEC-2 computer model include stream, bridge and culvert cross-section dimensions and elevations; roughness coefficients associated with the stream bed and overbank areas; expansion and contraction loss coefficients; and the distance between cross-sections and structures.

2.2.1 Starting Point

Profile computations for the Miller Drain, Middle Branch and North Branch of the Clinton River were begun at the mouth of each stream. The starting water surface elevations were determined from the 1979 FIS study. These water surface elevations were determined by backwater curves started at Lake St. Clair and carried on up to the mouth of each stream. From the profiles, stage discharge curves were established at the mouth of each stream. The flow used below the confluence were those when the stream in question was at peak discharge. The Clinton River and Clinton River Spillway were begun at the mean annual flood level of Lake St. Clair.

2.3 Miller Drain

In August 1991, a topographic survey was performed by Abrams Aerial Survey Corporation to develop maps with a scale of 1 inch equals 400 feet, with 2 foot contours. On May 1, 1992, a land survey was performed by STS. Two detailed cross-sections of the Miller Drain were obtained. This information was utilized to develop the cross-sections for the HEC-2 model. The following is the hydraulic model changes from the 1979 model, made by STS, for the Miller Drain.

1) Recorded bridge data for Heydenreich Road Bridge.

2) Changed contraction and expansion coefficients between Heydenreich crossing and Section No. 2270.

3) Adjust miscellaneous bank locations

4) Added Section No. 7390 to define downstream limit of channelized portions of drain.

5) Updated ground points data for Section Nos. 8510 to 10220 to reflect channelization.

6) Fixed numerous miscellaneous input errors and warning messages in original model[1].

Table 2 presents a cross-section reference between cross-section designations for the HEC-2 model, the land survey, and mapping in the FIS distances between cross-sections and structures for both the channel and overbank areas were obtained from the work map that was generated from the aerial survey.

Manning's Equation coefficients utilized in the computer model ranged from 0.03 to 0.08 for the stream channel and ranged from 0.04 to 0.1 in the stream overbank areas. Contraction and expansion coefficients *(Reference 3)* were established as 0.1 and 0.3 for smooth transitions, and 0.3 and 0.5 for abrupt transitions.

2.3.1 Results

Table 3 presents the floodplain elevations for the 10, 50, 100, and 500 year floods. Due to the backwater effect of the North Branch, flood elevations would be controlled by the North Branch. Re-evaluated flood elevations compared to the 1979 model did not change significantly. Vertical profiles of the Miller Drain flood elevations are presented in Appendix A.

2.4 North Branch Clinton River

In August 1991, a topographic survey was performed by Abrams Aerial Survey Corporation to develop maps with a scale of 1 inch equals 400 feet, with 2 foot contours On May 1, 1992, a land survey was performed by STS, and two detailed cross-sections of the North Branch were obtained at the former Little Road crossing. This information was utilized to develop the cross-sections for the HEC-2 model. The following is hydraulic model changes from the 1979 model, made by STS, for the North Branch of the Clinton River.

1) Corrected X3.10 data for Cass Avenue Bridge.
2) Fixed numerous miscellaneous input errors and warnings present in original model[2].
3) Adjust miscellaneous bank station locations.
4) Remove bridge data for old Little Road Crossing.

---

[1] Many changes were necessitated due to revisions to the HEC-2 code.

[2] Many errors were due to revised HEC-2 code.

10,220	592.20	593.05	593.34	594.08

Table 4 presents a cross-section reference between cross-section designations for the HEC-2 model, the land survey, and mapping in the FIS distances between cross-sections and structures for both the channel and overbank areas were obtained from the work map that was generated from the aerial survey.

Manning's Equation coefficients utilized in the computer model ranged from 0.045 to 0.068 for the stream channel and ranged from 0.04 to 0.1 in the stream overbank areas. Contraction and expansion coefficients *(Reference 3)* were established as 0.1 and 0.3 for smooth transitions, and 0.3 and 0.5 for abrupt transitions.

2.4.1 Results

Table 5 presents the floodplain elevations for the 10, 50, 100, and 500 year floods. Re-evaluated flood elevations compared to the 1979 model did not change significantly. Vertical profiles of the North Branch flood elevations are presented in Appendix A.

2.5 Middle Branch Clinton River

In August 1991, a topographic survey was performed by Abrams Aerial Survey Corporation to develop maps with a scale of 1 inch equals 400 feet, with 2 foot contours. This information was utilized to develop the cross-sections for the HEC-2 model. The following is hydraulic model changes from the 1977 model, made by STS, for the Middle Branch of the Clinton River.

1) Recorded bridge data for Heydenreich Road Bridge replacement, including weir data for road changes.

2) Fixed numerous miscellaneous input errors and warnings present in original model[1].

3) Changed contraction and expansion coefficient between Heydenreich Road and Section Number 6120.

4) Increased flood discharges based on approved changes. Above Miller drain, adjusted QT data based on same flow proportions as original model. Method approved by MDNR.

5) Recorded ground data for sections 5050 and 11700 based on revised topographic mapping.

---

[1] Many errors were due to changes in the HEC-2 code.

19,401	593.54	596.22	597.21	599.63

Table 6 presents a cross-section reference between cross-section designations for the HEC-2 model, the land survey, and mapping in the FIS distances between cross-sections and structures for both the channel and overbank areas were obtained from the work map that was generated from the aerial survey.

Manning's Equation coefficients utilized in the computer model ranged from 0.02 to 0.07 for the stream channel and ranged from 0.04 to 0.09 in the stream overbank areas. Contraction and expansion coefficients *(Reference 3)* were established as 0.1 and 0.3 for smooth transitions, and 0.3 and 0.5 for abrupt transitions.

2.5.1 Results

Table 7 presents the floodplain elevations for the 10, 50, 100, and 500 year floods. Due to the backwater effect of the North Branch, flood elevations would be controlled by the North Branch. Re-evaluated flood elevations compared to the 1979 model did not change significantly. Vertical profiles of the Middle Branch flood elevations are presented in Appendix A.

2.6 Floodway Calculation

The floodway for the three branches were calculated with HEC-2 encroachment method 1 and encroachment method 4. The floodways were determined by calculating a maximum increase in the base flood (100-year flood) water surface elevation of 0.1 feet increase. HEC-2 encroachment method 1 involves inputted encroachment stations in the right and left channels until a rise of 0.1 feet occurs in the floodway. HEC-2 encroachment method 4 computes encroachment stations based on the desired change in water surface elevation of 0.1 feet. Table 8 presents the floodway results for the North Branch, Middle Branch, and Miller Drain.

Note: Middle Branch and Miller Drain have backwater effect from the Clinton River.

3.0 COMPARISON OF RESULTS

The hydraulic profile of the Miller Drain, determined for the 1979 FIS has been changed. The floodway for Miller Drain, Middle Branch and North Branch have also recalculated from the 1979 study due to the updating of the HEC-2 code. The HEC-2 model has calculated the new floodways and are redrawn on 1979 FIRM map presented in Appendix C.

The floodplain and floodway for the North Branch of the Clinton River did not change significantly from the previous study. The position of the North Branch was better defined from Abrams Aerial Survey. Because of the reposition of the North Branch, the location of the floodway and floodplain did change from the 1979 FIS and are redrawn on the 1979 FIRM map.

The floodplain and floodway of the Miller Drain did change downstream of the corporate limits due to the rechannelization of the river. Further downstream of the Miller Drain, the floodplain and floodway did not change significantly.

The floodplain and floodway of the Middle Branch of the Clinton River did not change significantly from the previous study except at areas where the river location has changed based on the Abrams Aerial Survey.

4.0 CONCLUSIONS

STS has perform this hydraulic analysis report for the Clinton Township Flood Insurance Study. Specifically, the North Branch of the Clinton River, Middle Branch of the Clinton River, and the Miller Drain. This report was generated for the Federal Emergency Management Agency as part of the National Flood Insurance Program (contract no. EMW-91-C-3361).

The flood insurance study for the three branches of the Clinton River were initially performed in 1979. A new insurance study was performed due to the reconstruction of the Heydenreich Road Bridge over the Miller Drain and the Middle Branch, and a new channel configuration on the upstream portion of the Miller Drain.

The hydraulic analysis has shown that there has not been a significant change in the floodway and floodplain of the three branches of the Clinton River since the 1979 report, due to the reconstruction of the Heydenreich Road Bridge over the Miller Drain and the Middle Branch of the Clinton River. The floodway and floodplain location did change, however, due to the new channel configuration on the upstream portion of the Miller Drain.
