.000411	27.	27.	27.	2	0	6	0.00	250.00	600.00

Appears reasonable
structure is skewed, however
it appears water would be "piled" up
and eventually act as reservoir, with the
skew having no effect

00BREAK00

1) COUNTY: OAKLAND

2) STUDY NAME: FRANKLIN, VILLAGE OF

3) WATERCOURSE: ROUGE RIVER, FRANKLIN BRANCH

4) DOCUMENT TYPE: HYDRAULIC ANALYSIS

00BREAK00

FLOOD INSURANCE STUDY HYDRAULIC REPORT

PROJECT: HUD-FIA-H-4705 Franklin Village and Bloomfield Twp., Oakland Co., Michigan

CONSULTING FIRM: McNamee, Porter and Seeley/Smith, Hinchman and Grylls

WATERCOURSE: Franklin Branch - Rouge River

STUDY LIMITS: Telegraph Rd., - corporate limits (downstream limit) to just downstream Inkster Rd.-corporate limits (upstream limit)

DATE OF AERIAL SURVEY: Franklin work map-April, 1971 (x-section 100% field surveyed) Bloomfield Twp. Portion-November, 1978 (underwater field surveyed)

DATE OF LAND SURVEY: McNamee, Porter and Seeley field crew 1/8/79 - 1/25/79, 4/3/79, 6/7/79 (Franklin Village and Bloomfield Twp.)

SOURCE OF FLOWS: Discharges were computed by MP&S/SH&G and approved by MDNR on 2/15/79.

TOPOGRAPHIC INFORMATION: Franklin - 4 foot topographic map 1"=200'
Bloomfield Twp. 2 contour topographic map - 1"=200'

METHOD OF ANALYSIS: HEC-2 water surface profile computer program

VARIABLES AND COEFFICIENTS:

Channel "n"	.055 - .065*
Overbank "n"	.085 - .095*
n values thru bridges	0.013 - 0.025
Contraction Coefficients	0.2 - 0.4
Expansion Coefficients	0.4 - 0.8

*Final Value Raised by 30% "N x 1.3 was used due to severe meandering of Stream"

Bridge loss coefficients were chosen per References 1 and 2.

PHOTOGRAPHS: Enclosed for your review, please return

CROSS-SECTIONS: See Table 1 for cross-section description. Cross-section plots enclosed

XKOR-CALCULATIONS: See Table 2

HIGH WATER MARKS & CALIBRATION

No high water marks were available for use in calibrating the HEC-2 model for the Franklin Branch-Rouge River.

A sensitivity analysis was performed on the 100 year flow by raising and lowering all Manning "n" values by 30%. Water surface elevations differed on the average by ±0.5 feet. Due to the severe meandering of the Rouge River, the Manning "n" values were raised by 30% and used for all flows in Franklin Village and Bloomfield Twp. In addition, over-bank lengths are equal to river channel lengths in order to better model the hydraulic losses expected in the overbanks.

STARTING CONDITIONS

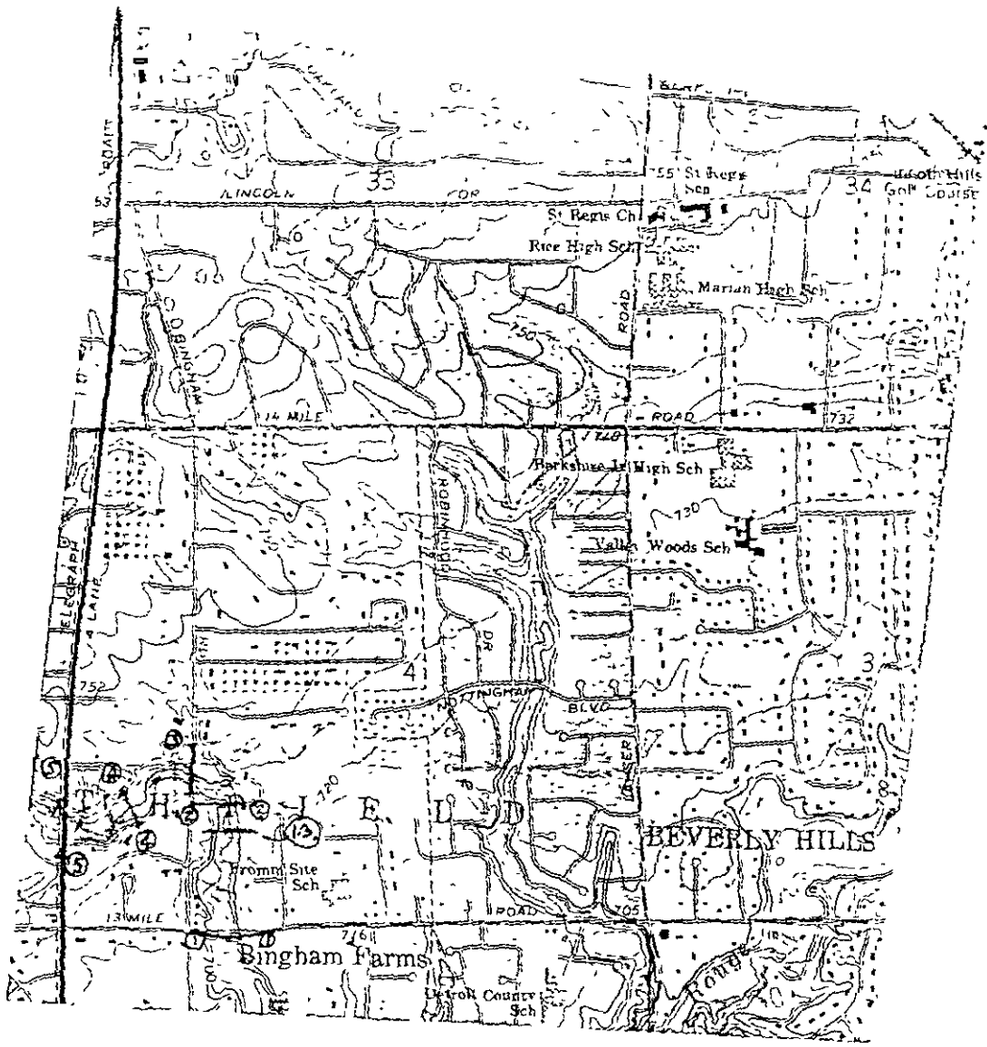
Field information was obtained about 4000 ft. downstream of the corporate limits of Franklin Village in order to establish a good starting elevation of the corporate limits. Normal depth was assumed for the starting elevation. The slope-area method was used to determine this starting elevation for all flows, utilizing the value of slope determined from the field surveyed cross-sections. A convergence test was run on the 100 yr. flow by changing the starting elevation determined by the slope-area method by ±1.5 feet. The convergence test was run to just inside the corporate limits, with the results indicating very good convergence at this point.

DESIGNATED FLOODWAY

Encroachment method 4 in the HEC-2 program was used to determine encroachment stations based on an allowable surcharge of 0.1 feet. At field surveyed sections the designated floodway was established using the computer determined encroachment stations. Between field surveyed sections, the available topographic information was used to complete the floodway delineation. (See the enclosed 1"=200' topographic maps for floodway delineation).

COMPUTER OUTPUTS

Enclosed are complete outputs for (i) 100 year natural and 100 year designated floodway (ii) 10, 50, and 500 year flood plain elevations, and (iii) sensitivity analysis and convergence test (downstream of limit of study) for your review.



COMMENTS

At Telegraph Rd. (cross-sections 4.98-5.02), pressure flow occurs for the 50, 100, and 500 year floods. Therefore, the special bridge routine is used. The ELLC was lowered from 709.1 to 708.5 for the 10 year flood in order to correctly model pressure flow with the special bridge routine.

The downstream runs which were made to determine starting elevations were started at cross section 1.3, not at 13 Mile Road (cross section 1-refer to Figure 1). Cross section 1 is located 1250 feet downstream of cross section 1.3. Utilizing information about the bridge, and knowing the flows, it was determined this bridge would not control further upstream and was not included in the model. There is a footbridge located near cross section 1.3. It was determined to cause negligible loss and was therefore excluded from the model also.

The 100-year flood plain has been delineated for the Franklin Village as well as for the Bloomfield Twp. However, as for Bloomfield Twp. the 100-year floodplain delineation will be finalized by Abrams.

FIGURE 1

FRANKLIN VILLAGE -
DOWNSTREAM X-SECTIONS
FROM DOWNSTREAM LIMIT
OF STUDY - FOR STARTING
ELEVATION DETERMINATION

Note: There were cross sections taken upstream and downstream of the bridges noted above, however the locations of these are not noted above. For location and description of these Field surveyed sections, see the x-section table and the downstream computer runs.

$XKOR = 1 + K_e + K_f$ $\quad K_f = \frac{29n^2\ell}{R^{4/3}}$ $\quad R = A/P$

Cross Section Location	K_e	A	P	R	n	ℓ	K_f	XKOR	REMARKS
4.98-5.02	0.4	116.7	—	—	.013	340	0.8*	2.2	Telegraph Rd
8.98-600.02	0.55	51.1	44.	1.16	.025	27	0.4	1.95	14 Mile Rd
600.98-601.02	0.4	117.2	62.6	1.87	.013	41	0.1	1.5	Franklin Rd.

* Obtained K_F for Telegraph Rd From Kequiv calculation From Bridge Routine Book by Corp of Engs. Used this eqn because there are 3 culverts present: two 90"Ø and one 120"Ø, with the 120"Ø having a higher maximum low chord than the other two.

500-year Flood Boundary ——

100-year Flood Boundary ——

FLOODWAY FRINGE — FLOODWAY

100-year Flood Boundary ——

500-year Flood Boundary ——

Elevation Reference Mark RM7

Cross Section Line (A)—(A)

NOTES TO USER

Boundaries of the floodways were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations without regard to economic, legal, or political factors.

This map was prepared to support minimum flood plain management regulations; it may not show all areas subject to flooding in the community or all planimetric features outside special flood hazard areas.

HYDRAULIC ANALYSIS

INTRODUCTION

The stream being studied in this analysis is Pettibone Creek in the Township of Highland, Oakland County, Michigan. The lakes connected by Pettibone Creek and included in this study are Moore, Lower Pettibone, Alderman, Leonard, Upper Pettibone, Duck, and White. Also included is Harvey Lake, which is independent of Pettibone Creek, and has no outfall. The study limit begins at the southern township boundary, which bisects Moore Lake. The study area is bounded to the west by Milford Road, to the north by White Lake Road, and to the east by Ormund Road and the Highland State Recreation Area. To insure that an accurate starting water surface elevation for Moore Lake is established, this hydraulic analysis begins approximately 4700 feet downstream of the township boundary, where Pettibone Creek crosses the northern corporate boundary of the City of Milford.

The flows used in this study have been established using the hydrological computer program described in Technical Release No. 20 compiled by the U.S. Department of Agriculture Soil Conservation Service (Reference 1). Initially the starting water surface elevations used at Section 0.0 of this analysis were determined by the slope-area method described in the HEC-2 Water Surface Profiles Users Manual (Reference 2). However, it was found that inlet control exists at the C&O Railroad culvert, Section 569. Therefore, a stage-discharge curve for this culvert was established, and the starting water surface elevations determined at this station.

The project manager for this study is Robert Mihos.

METHOD OF ANALYSIS

This study has been conducted using an iterative process involving the COE HEC-2 step-backwater computer program and the SCS TR-20 hydrology program. Stage-discharge relations for each of the lakes linked by Pettibone Creek required by the TR-20 program are generated by running multiple flows in the HEC-2 computer model. The TR-20 program simulates runoff for the four predetermined events,

into the various lakes, routes the collected runoff, and yields discharges and water surface elevations for each lake in the chain. The peak flow for each lake resulting from a particular storm event is then used in the HEC-2 computer program to establish flood elevations and refine the stage-discharge characteristics of the lakes. The revised data is installed in the TR-20 program which generates new flows and elevations. As this process is repeated, specific flows for each event are converged upon and final flood elevations are determined.

In this study there are two dams which have breached dikes. The first dam is at Section 17495, just north of Grubb Road. The reconstruction of this dam, in conversations with the MDNR (Reference 4), has been suspended and the scheduled completion date is unknown. Due to the uncertain condition of the reconstruction at this dam, the assumed HEC-2 model considers the by-pass channel around the dam and the existing headwalls at the time of field survey.

Aug 3, 1981 Revision include this reconstructed dam

The second dam, Section 20519, which is north of M-59, appears to have been abandoned permanently, and has been modelled accordingly with use of encroachments.

Within the HEC-2 program, bridges which are under low flow conditions for all four flows are coded according to the "normal bridge" routine requirements. The "special bridge" routine or hand calculations were used to determine the upstream water surface elevation for bridges experiencing pressure or weir flow for any of the four flows. The hydraulic model has been developed for the 100 year flow.

Valley sections upstream and downstream of bridges are located where full cross section flow would be developed out of the influence of the bridge constriction. The criteria for placement of these sections is that outlined on pages 18-21 of the HEC Training Document No. 6, Application of the HEC-2 Bridge Routines (Reference 3). Accordingly, the downstream section is placed at a distance of about four times the average length of the side constriction caused by the bridge abutment. The upstream section is placed at a distance about equal to the bridge constriction. If additional sections were found necessary within this distance or if the actual field-surveyed cross section fell within this distance, the intermediate sections were encroached as appropriate.

CROSS SECTION DATA AQUISTION

Cross section data for the computer model of Pettibone Creek has been obtained from two sources: Johnson & Anderson (J&A) and Abrams Aerial Survey (AAS). Field crews from J&A collected field elevations and structure data at each section during March, 1980. Primary emphasis was placed on obtaining detailed channel cross sections. This information was then supplemented with overbank elevations determined by AAS (Reference 5). Additional data used in establishing stage-discharge curves for White Lake were taken from construction plans prepared by J&A and field survey.

VARIABLES AND COEFFICIENTS

The Mannings "n" values have been selected by comparing photos taken during field inspection in March and October 1980 with photographs and descriptions from Open-Channel Hydraulics, (Reference 6) pp. 101-123 and Roughness Characteristics of Natural Channels (Reference 7).

For channels, the "n" values varied generally from 0.035 for smooth sandy stream beds to 0.045 for winding reaches with weed growth along the banks and fallen timber. Sections adjacent to lakes were given "n" values closer to 0.030, while those of irregular courses with rough edges, stone, weeks and fallen timber were rated as high as 0.052

The Mannings "n" values for the overbanks varied from as low as 0.050 for residential lawns to as high as 0.125 for flood plains characterized by heavy stands of timber with dense underbrush. Typically, the overbank values ranged between 0.065 and 0.100.

The expansion and contraction coefficients employed in this analysis were 0.5 and 0.3, respectively.

SPECIAL PROBLEMS

There were three different occasions in this study where it was necessary to supplement the computer analysis with hand calculations to more correctly model

hydraulic structures along Pettibone Creek. The first occurred at the C & O Railroad culvert (Section 569) downstream of the study boundary. The geometry of this culvert is such that the condition of inlet control exists when the flow exceeds 50 cfs and inlet control with weir flow when the flow exceeds 185 cfs. To establish the proper water surface upstream of the culvert, inlet control headwater values were plotted and combined with a computer-generated weir rating curve to create a stage-discharge curve for this structure. As the four flows for the different storm events are converged upon, water surface elevations upstream of this culvert corresponding to each flow were read off this curve and placed on an X5 card.

The second structure requiring supplemental hand calculations was the Harvey Lake Road culvert (Section 26430). This culvert has a weir plate at the upstream end to maintain the level of Leonard Lake. As neither bridge routine of the HEC-2 program produced reasonable values for Leonard Lake water surface elevations, it was decided to model the pipe opening above the weir plate using the critical depths of flows through an arch pipe of similar end section dimensions. These depths were compared to the normal depths in the pipe for a series of flows, which in turn were compared to tailwater elevations to assure that the weir was not being influenced by a backwater. A velocity head was added to the critical depths for flows over the weir to obtain water surface elevations for Leonard Lake, which were used on an X5 card. Another structure requiring special calculations was the Grubb Road culvert. Inlet control exists for range of flows used in this study. Headwater elevations for each flow for this condition were used on an X5 card for the upstream face cross section of Grubb Road.

Hand calculations for these special problems can be found in Appendix C of this report.

SHIAWASSEE RIVER
HOLLY PATTERSON DRAIN
HOLLY TWP.
VILLAGE OF HOLLY

HYDRAULIC AND HYDROLOGY ANALYSIS

1. Introduction

The two main streams being investigated in this report are the Shiawasee River and the Holly-Patterson Drain through the City of Holly and Holly Township, Michigan. The Shiawasee River consists of a few unnamed tributaries, as is the Holly-Patterson Drain. In this study the hydrographs of each tributary were established. The hydrographs at each confluence point with a tributary and at the outlet of each control structure were also established for both study streams. The analysis technique will be described in Section 2.

2. Method of Analysis

2.1 Background Information

The study area is divided into three (3) sections according to the type of analysis used. The Holly-Patterson Drain consists of several large lakes with short reaches of channels between. The lakes serve as large storage areas during storm flows. The Shiawasee River consists of a channel reach from the starting section to the Mill Pond. The area upstream of the Mill Pond consists of a high percentage of swampy areas with several lakes that serve as storage areas.

2.2 TR-20 and HEC-2

2.2.1 Holly-Patterson Drain

As mentioned in Section 2.1, the several lakes between the Holly-Patterson Drain will serve as reservoirs in regulating the peak flow calculation, the TR-20 was employed in the analysis. The total basin has been divided into six (6) subbasins and three (3) control structures were encountered in the routing. The major difficulty involved, then is the adequate method to develop a meanful stage - discharge curve for each structure. Structure 01 is a bridge opening downstream of the lake. Without knowing the downstream stage, the upstream stage of the bridge cannot be established. Without knowledge of the energy slope, the control stage at the downstream embankment cannot be established either. This problem was solved by HEC-2 backwater program.

The drainage area, CN number, and the time of concentration for each subbasin and the locations of cross sections and structures are shown in Figure 1. Figure 1 also shows the flow diagram of the TR-20 computation. In this report the data sheets for the SCS method at each subbasin and the stage - discharge relation for each structure resulting from HEC-2 backwater computations are included. The stage - discharge relations for structure 02 and 03 are hand calculated.

2.2 TR-20 and HEC-2 (continued)

2.2.2 Shiawasee River

The water surface profiles for the Shiawasee River from the starting cross-section to the Mill Pond was determined using the HEC-2 computer program, developed by Hydrologic Engineering Center, United States Army Corps of Engineers.

The area upstream of the Mill Pond was modeled using the TR-20 computer program. Since a large percentage of the area upstream consists of swampy areas, the input for rainfull was reduced according to SCS recommended methodology. Since approximately 15 percent (15%) of the area in the drainage basins is swampy areas or ponding areas, a factor of .69 was used to reduce flows.

how was this arrived at? Is it in Table E-3 Appendix H or Rio reports SCS UD-21 method

00BREAK00

1) COUNTY: OAKLAND

2) STUDY NAME: INDEPENDENCE TOWNSHIP

3) WATERCOURSE: SASHABAW CREEK

4) DOCUMENT TYPE: HYDRAULIC ANALYSIS

00BREAK00

FLOOD INSURANCE STUDY HYDRAULIC REPORT

PROJECT: HUD-FIA-H-4705 Township of Independence, Oakland Co., Michigan

CONSULTING FIRM: McNamee, Porter and Seeley/Smith, Hinchman and Grylls

WATERCOURSE: Sashabaw Creek

STUDY LIMITS: 200' D/S Mann Rd. to 150' U/S Maybee Road.

DATE OF AERIAL SURVEY: Abrams Aerial Survey - November 1975

DATE OF LAND SURVEY: McNamee, Porter and Seeley Field Crew 10/22/80, 11/13-14/79

SOURCE OF FLOWS: Flows computed using the Hydrocomp model by J & A, received from the DNR 6/26/80

TOPOGRAPHIC INFORMATION: Abrams 2 foot topographic map 1" = 400'

METHOD OF ANALYSIS: HEC-2 water surface profile computer program

VARIABLES AND COEFFICIENTS:

Channel "n"	.045
Overbank "n"	.060-.080
n values thru bridges	.025
Contraction Coefficients	.1-.4
Expansion Coefficients	.3-.8

Bridge loss coefficients were chosen per References 1 and 2.

PHOTOGRAPHS: Enclosed for your review, please return.

CROSS-SECTIONS: See Table 1 for cross-section description. Cross-section plots enclosed.

REFERENCES:

Starting Conditions

Normal depth was assumed for the starting condition approximately 200 feet downstream of Mann Road in Independence Township. The slope-area method was used to determine the starting elevation for all flows, utilizing the value of slope determined from the field surveyed profile. A convergence test was run on the 100-year flow by changing the starting depth determined by the slope-area method by ±15%.

High Water Marks and Calibration

There was no high water information available. Therefore, a calibration test was not possible.

A sensitivity analysis was performed on the 100 year flow by raising and lowering all Manning "n" values by 30%.

Designated Floodway

Encroachment method 4 in the HEC-2 program was used to determine encroachment stations based on an allowable surcharge of 0.1 feet. Please note that at some locations encroachment method 1 superceded method 4. At these locations the floodway delineation was arrived at after studying 1) topography information to locate any structures or other obstructions and 2) cross-section plots. These cross-sections were modified to exclude ineffective overbank areas, based on 1) velocity considerations 2) the presence of structures and 3) expansion and contraction of 1:4 and 1:1 respectively, near bridges.

Computer Outputs

Enclosed are computer outputs fir (i) 100 year natural and 100 year designated floodway (ii) 10, 50, and 500 year flood plain elevations and (iii) convergence test and sensitivity analysis for your review.

Source of Flows

The original hydrology submittal by McNamee, Porter and Seeley for this portion of Sashabaw Creek was based on a unit hydrograph developed from three storms of record. Although this method is appropriate and yielded a representative unit hydrograph for this basin, the DNR did not concur with the infiltration value used in its application. Instead, it was decided to use the flows

developed using the HYDROCOMP simulation as completed by Johnson and Anderson Consulting Engineers. These flows are nearly identical to the flows that would be calculated using the unit hydrograph with an "f" value of .7 in/hr. This is representative of the infiltration capacity observed during the June 25, 1968 storm. Therefore, we concur with the use of the HYDROCOMP flows. They are as follows: 10 yr. - 205 cfs, 50 yr. - 345 cfs, 100 yr - 410 cfs, and 500 yr. - 590 cfs.

Comments

We have not delineated the complete 100 or 500 year flood plains at this time since this will be done by Abrams after DNR approval of the 100 year and 500 year flood elevations (see the enclosed profile for the 10, 50, 100 and 500 year natural computed water surface profiles).

Please note that in order to model the 10 year water surface correctly using the HEC-2 model, the low chord elevation at Pine Knob Rd. was lowered.

JOB : HUD-FIA H-4705
COMMUNITY: Township of Independence, Oakland Co.
WATERCOURSE: Sashabow Drain

TABLE 1 - SECNO

Section Types:	Description
1	Surveyed (See Remarks if Other Than MPS and/or Abrams)
2	Field Survey Section; partly modified For modelling
3	Synthetic - Repeat of nearby surveyed section with an invert adjustment (See Remarks)
4	Synthetic - Developed from topo, surveyed sections, or other information

TABLE 1 - SECNO

Section Types	Description
1	Surveyed (See Remarks if Other Than MPS and/or Abrams)
2	Field Survey Section ; partly modified For modelling
3	Synthetic - Repeat of nearby surveyed section with an invert adjustment (See Remarks)
4	Synthetic - Developed from topo, surveyed sections, or other information

	Section No.	Section Type	Remarks
	30.82	3	D/S Face Footbridge Repeat 40 w/ invert change
I	30.84	3	U/S Face Footbridge Repeat 40
J	40.0	1	Valley Section
	41.2	3	D/S Face Footbridge, repeat 40
K	41.3	3	U/S Face Footbridge, repeat 40
	49.7	4	Repeat 50.2 w/ invert adjustment
L	50.2	1	Valley Section, restrict available topwidth
	50.205	3	Repeat 50.2
	50.3	3	Valley section just D/S Maybee Rd. Repeat 50.8 w/ invert adjustment
	50.33	1	Modelling of Face D/S Face Maybee Rd.
M	50.34	3	Modelling of Face U/S face Maybee Rd. Repeat 50.33
	50.4	3	Repeat 50.8, just U/S Maybee Rd
N	50.8	1	Valley Section
