The State of Arthritis in Michigan

2005

Michigan Department of Community Health

- Chronic Disease Epidemiology Section, Division of Genomics, Perinatal Health & Chronic Disease Epidemiology
- Diabetes & Other Chronic Diseases Section, Division of Chronic Disease and Injury Control

This presentation was supported by cooperative agreement number U58/CCU52826-01-04 from the Centers for Disease Control (CDC) and Prevention. Its contents are solely the responsibility of the authors and do not necessarily represent the official views of CDC.
“Arthritis” refers to more than 100 diseases and conditions affecting the joints, the surrounding tissues, and other connective tissues.

Arthritis and other rheumatic conditions include osteoarthritis, rheumatoid arthritis, systemic lupus erythematosus, juvenile rheumatoid arthritis, gout, bursitis, rheumatic fever, Lyme arthritis, carpal tunnel disease and other disorders.

What is Arthritis? (cont.)

Our working definition:

A “Yes” response to the question: “Have you ever been told by a doctor or other health professional that you have some form of arthritis, rheumatoid arthritis, gout, lupus, or fibromyalgia?”
Risk Factors for Arthritis

- Gender (female)
- Older age
- Genetic predisposition
- Obesity
- Joint injuries
The Prevalence of Arthritis in Michigan

In 2005, 30.9 percent, or 2.4 million, of all Michigan adults reported that they had ever been told by a doctor or other health professional that they had arthritis.

Source: 2005 Michigan Behavioral Risk Factor Survey
The Prevalence of Arthritis in Michigan

Michigan had the sixth highest rate of self-reported doctor-diagnosed arthritis among the 50 states and District of Columbia in 2005.

Source: 2005 Behavioral Risk Factor Survey
If current rates continue into the future, the number of Michigan adults with arthritis will increase by 21% between 2005 and 2030 to close to 3 million people. (Source: U.S. Census Bureau and 2005 Michigan Behavioral Risk Factor Survey)
Percentage Distribution of Michigan Adults With Arthritis, 2007

Source: 2007 Michigan Behavioral Risk Factor Survey
Percent With Arthritis Among Michigan Adults With Selected Diseases in 2007

- Diabetes: 58.9%
- HBP: 53.9%
- CVD: 65.4%
- Osteoporosis: 73.2%

(Source: 2005 Michigan Behavioral Risk Factor Survey)
Impact of Arthritis in Michigan

The Health and Functional Status of Persons with Arthritis
Adults with arthritis were three times more likely than those without to report fair or poor health status and frequent recent activity limitations.

Source: 2005 Michigan Behavioral Risk Factor Survey
Persons with arthritis were much more likely to report also having the major chronic diseases above than persons without arthritis. (HBP=high blood pressure or hypertension; CVD=cardiovascular disease)
In 2005:

11.1% of the Michigan adult population (approximately 850,000 people) reported that they were currently limited in their usual activities because of arthritis or joint symptoms.

36.4% of the Michigan adult population with arthritis were currently limited because of their arthritis or joint symptoms.

Source: 2005 Michigan Behavioral Risk Factor Survey
Michigan had the ninth highest prevalence rate of self-reported activity limitation due to arthritis among the 50 states and District of Columbia.

Source: 2003 Behavioral Risk Factor Survey. Data for 2005 for all states were not available at the time of this publication.
Projected Number of Michigan Adults With Activity Limitations Due to Arthritis, 2005-2030

If current rates continue into the future, the number of persons with activity limitations due to arthritis will increase by 21% between 2005 and 2030 and will surpass one million by 2025.

Source: U.S. Census Bureau and 2005 Michigan Behavioral Risk Factor Survey
Which Michigan adults with arthritis were most likely to report activity limitations due to their arthritis in 2005?

Those who:

- Were age 75 and over
- Were females
- Were non-Hispanic non-whites
- Did not complete high school
- Lived in households with incomes < $20,000/year
- Were obese
- Did not engage in leisure-time physical activity

Source: 2005 Michigan Behavioral Risk Factor Survey
Michigan adults with arthritis were more likely than those without to be obese and not engage in leisure-time physical activity. This puts them at greater risk for other chronic diseases like diabetes and cardiovascular disease and for greater disability from their arthritis.

Approximately one-third (645,000 people) reported that arthritis or joint symptoms now affected whether they work, the type of work they do, or the amount of work they do.

- 29.7% (or 192,000) of these people reported that they lost one of more days of work due to their arthritis or joint symptoms in the past 30 days.

Management of Arthritis

Care provided by a physician or other health professional
“In the past 12 months, has there been an occasion when you needed care for your arthritis but were not able to get it?”

(Asked of Michigan Adults With Arthritis in 2005)

92.6%

Most Michigan adults with arthritis were able to get care for their arthritis when they needed it.
If you were not able to get care...

“What prevented you from getting (arthritis) care?”

- 29.2% No insurance
- 22.5% Too expensive
- 15.0% No access to specialist
- 13.0% Insurance does not cover
- 20.3% Other

Insurance barriers (42.2%) and the cost of care (22.5%) were the most common reasons given for not getting needed arthritis care.

Source: 2005 Michigan Diabetes, Arthritis and Osteoporosis Survey
Who was significantly more likely to NOT be able to get arthritis care?

- Males vs. females
- Blacks vs. white or other
- Lowest income group (< $35g / yr) vs. middle income group ($35g-$74 / yr)

Source: 2005 Michigan Diabetes, Arthritis and Osteoporosis Survey
Nearly one-third (31.8%) of persons with arthritis who were obese reported that a doctor or other health professional did not ever suggest losing weight to help their arthritis or joint symptoms.

Just over one-half (51.6%) of persons with arthritis who did not engage in leisure-time physical activity reported that a doctor or other health professional did not ever suggest physical activity or exercise to help their arthritis or joint symptoms.

Source: 2005 Michigan Behavioral Risk Factor Survey
Between 2000 and 2004, the numbers of arthritis-related knee and hip replacements among Michigan adults increased by 69% and 40%, respectively. (Source: Michigan Inpatient Data Base, 2000-2004)
The numbers of these procedures are increasing faster among persons age 45-64 compared with persons age 65 and over.

These procedures are performed at a two-fold higher rate among white Michigan adults compared with blacks.

Source: Michigan Inpatient Data Base, 2000-2004
These procedures often reduce pain and improve function.

However, these procedures are very expensive. In 2004, the estimated cost (for hospitalization only) of these procedures in Michigan was $878 million.

(Sources: American Academy of Orthopedic Surgeons & Michigan Inpatient Data Base, 2004)

Prevention and better management of osteoarthritis could reduce the need for many of these procedures.
Management of Arthritis

Self-management
## Arthritis Self-Management Classes

- 47.5% of Michigan adults with arthritis said they would go to an arthritis self-management class if it was available near where they live or work. (Source: 2005 Michigan Diabetes, Arthritis and Osteoporosis Survey)

- 12.5% of all Michigan adults with arthritis in 2005 reported that they had taken an “educational course or class to teach them to manage problems related to their arthritis or other joint symptoms.” (Source: 2005 Michigan Behavioral Risk Factor Survey)

- This suggests that there is a large group of Michigan adults who may be interested in taking a self-management class but have not yet done so.
There is a need for expanding the number of arthritis self-management classes (and other Arthritis Foundation classes) in Michigan into areas where these programs are not currently unavailable.
Public Knowledge/Opinions About Arthritis
“Moderate physical activity, if done regularly, can reduce overall pain for someone with arthritis.”
(Asked of Michigan Adults With Arthritis, 2005)

The vast majority of Michigan adults with arthritis agree that their pain can be decreased by moderate exercise.
(Source: 2005 Michigan Diabetes, Arthritis and Osteoporosis Survey)
However, only 50.1% of the persons with arthritis who agreed with this previous statement reported that they themselves exercised moderately for at least 30 minutes per day five days per week or vigorously for 20 minutes per day three days per week.

Source: 2005 Michigan Diabetes, Arthritis and Osteoporosis Survey
Summary

Arthritis is:

- highly prevalent (31% of MI adults were told by a health professional that they have it),
- not just a disease of older people (two-thirds of adults with arthritis are under age 65), and
- is common among persons with other chronic diseases (1/2-2/3 of those with diabetes, hypertension, cardiovascular & osteoporosis have it).
Summary, cont.

Arthritis and related disability:

- have a strong adverse impact on:
  - the health of those affected (decreased self-rated health status and increased activity limitation)
  - the economy (decreased productivity and increased absenteeism and health care costs);
- will steadily increase in prevalence in Michigan if present rates continue;
- are associated with obesity and physical inactivity; and
- can be managed and reduced by expanded exercise and self-help programs.
