Surround Your Baby With A Vaccinated Family
VACCINATE YOUR FAMILY MEMBERS AGAINST PERTUSSIS (WHOOPING COUGH)

What Is Pertussis?
- Pertussis is a serious disease. Symptoms can include: a runny nose, mild fever and a cough. The cough then turns into severe coughing fits and can last six or more weeks.
- Did you know that pertussis is especially dangerous in newborns because they are too young to receive the pertussis vaccine?
- The disease causes infants to cough so much, that some have trouble breathing, leading to hospitalization and potentially death.

Not Just Kids Are At Risk
- Pertussis easily spreads from person to person, family member to family member.
- Family members can unknowingly spread pertussis to the most vulnerable, your own babies.
- Anyone that has not been vaccinated against pertussis (Tdap vaccine) is at a higher risk of getting pertussis and passing it on to an infant or child.

Protect Your Family
- Vaccinate family members with a Tdap vaccine to protect against pertussis.
- Don’t forget that this includes your teens, grandparents and close family friends.
- Talk to your doctor or call your health plan for Tdap vaccine information.
