Michigan Flu Focus
Weekly Influenza Surveillance Report

Editor: Sue Kim, MPH
Editor Email: KimS2@michigan.gov
December 2, 2019
Vol. 17; No. 08

Week Ending November 23, 2019 | WEEK 47

Michigan Influenza Activity

- No Activity
- Sporadic
- Local
- Regional
- Widespread

*Clicking on the current activity level will direct you to the CDC webpage defining each activity level for the geographic spread of influenza.

Updates of Interest

Nationally, influenza B/Victoria viruses have been reported more frequently than other influenza viruses so far this season; followed by influenza A/H1N1 and influenza A/H3N2 viruses, which have also been circulating in significant numbers.

Please see the following link to CDC’s FluView report for more details: https://www.cdc.gov/flu/weekly/index.htm#S1

Influenza-associated Pediatric Mortality

Nationally, five (5) influenza-associated pediatric deaths have been reported thus far for the 2019-2020 flu season. No (0) pediatric influenza deaths have been confirmed by MDHHS for the 2019-2020 flu season.
U.S. Outpatient Influenza-like Illness Surveillance Network (ILINet)

Michigan participates in ILINet, a collaborative effort between the CDC, state and local health departments, and volunteer sentinel clinicians as part of Michigan’s influenza surveillance. ILINet provides data on the total number outpatient visits to health care providers seen for any reason and the number of those patients with influenza-like illness (ILI). For this system, ILI is defined as fever (temperature of 100°F [37.8°C] or greater) and a cough and/or a sore throat without a known cause other than influenza.

Number of Reports and ILI % by Region in Michigan during this time period:

<table>
<thead>
<tr>

</table>

Data is provisional and may change as additional reports are received.

Michigan ILI Activity

1.2%
(Last week: 1.0%)
Regional Baseline*: 1.9%

A total of 159 patient visits due to ILI were reported out of 13,363 office visits during this period.

*Regional baseline is determined by calculating the mean percentage of patient visits due to ILI during non-influenza weeks for the previous three seasons and adding two standard deviations

National Surveillance

In the United States, 2.9% of outpatient visits were due to ILI. (Last week: 2.5%) This is above the national baseline of 2.4%

Influenza Hospitalization Surveillance Project (IHSP)

The CDC’s Influenza Hospitalization Surveillance Network (FluSurv-NET) provides population-based rates of laboratory-confirmed influenza-associated hospitalizations from October 1st through April 30th each year. Michigan participates as an IHSP state in FluSurv-NET for Clinton, Eaton, Genesee, Ingham, and Washtenaw Counties.

There were 17 (1 pediatric, 16 adult) influenza-associated hospitalizations reported to MDHHS for the IHSP during this time period. Since October 1st, 29 (3 pediatric, 26 adult) influenza-related hospitalizations were reported in the catchment area for the 2019-2020 season.

Join the Influenza Sentinel Hospital Network (ISHN)!

What is it? ISHN is a group of hospitals in Michigan that voluntarily report weekly aggregate counts of influenza positive inpatients to assist MDHHS with statewide flu surveillance

How it works: As a participating hospital in the ISHN, you would complete a brief Survey Monkey every week containing:
- Number of hospitalizations with a positive influenza test by age group during that time period
- The total number of hospitalizations due to any condition during that time period (if available)

The data you provide is aggregated by region and can assist providers and public health in recognizing changes in the age or geographic distribution of flu in this population.

If your facility is interested in participating or would like more details, please contact Sue Kim (KimS2@michigan.gov)
There were 19 new positive influenza results (10C, 0N, 4SE, 5SW) reported by the MDHHS Bureau of Laboratories (BOL) during this time period.

New Study: More Evidence that Maternal Flu Vaccination Protects Infants for the First Months of Life

A recent study published in the Journal of Infectious Diseases adds to the evidence that immunizing pregnant women helps reduce lab-confirmed flu and hospitalizations in babies younger than 6 months old.

The study, from a team at Public Health England, utilized data from a clinical practice database and a pregnancy registry allowing researchers to assess pregnancy timing and maternal flu vaccine uptake.

Goal: Reassess the effectiveness of flu vaccination in pregnant women to prevent flu and flu-related hospitalizations in infants less than 6 months of age during the 2013-14 and 2014-15 flu seasons

Results:

- Overall vaccine effectiveness (VE) 2013-14 flu season – 66% (95% CI: 18% - 64%)
- Overall VE 2014-15 flu season – 50% (95% CI: 11% - 72%)
- VE against flu hospitalizations 2013-14 flu season: 61% (95% CI: -5% - 85%)
- VE against flu hospitalizations 2014-15 flu season: 50% (95% CI: 6% - 73%)

These results support previous studies conducted in Bangladesh and South Africa and should encourage providers to continue to offer influenza vaccine to pregnant women. Additionally, every person aged 6 months and older should get their flu vaccine every year especially pregnant women.

Influenza Vaccine Updates

National Influenza Vaccination Week December 1st-7th 2019

National Influenza Vaccination Week (NIVW), December 1-7, is an awareness week hosted by the Centers for Disease Control and Prevention (CDC) highlighting the importance of influenza vaccination.

NIVW is a great reminder to healthcare providers to continue vaccinating their patients against flu throughout the holiday season and beyond. During the 2018-2019 flu season, influenza activity in Michigan did not peak until March which indicates that there are many opportunities to continue to offer flu vaccine to unvaccinated patients.

CDC has developed an extensive list of tools and campaign resources for NIVW including web tools, videos, communication resources, graphics and more.

Visit www.cdc.gov/flu/nivw for more information.
