This presentation provides updated infant health statistics for prosperity region 7 in the State of Michigan.

This presentation was prepared by the Maternal and Child Health Epidemiology Section, Michigan Department of Health and Human Services (MDHHS).

Data source: Michigan resident live birth files (12/12/2018) and infant mortality files (01/23/2019), Division for Vital Records and Health Statistics, MDHHS

Revised: June 2019
The next several slides contain updated infant mortality rate statistics for prosperity region 7 in the State of Michigan.
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the infant mortality rates within prosperity region 7 from 2010 through 2017. Infant mortality is defined as a death of a baby before his or her first birthday and is expressed as a rate per 1,000 live births. The infant mortality rate in prosperity region 7 has fluctuated quite a bit over the last eight years, but appears to be on a downward trend since 2015. In 2017, the infant mortality rate was 6.8 infant deaths per 1,000 live births for the State of Michigan and 4.1 infant deaths per 1,000 live births within prosperity region 7.
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average infant mortality rates by census tract within prosperity region 7 for 2013-2017. Infant mortality is defined as a death of a baby before his or her first birthday and is expressed as a rate per 1,000 live births.

Light green: no live births;
Grey: no infant deaths;
Yellow: below the mean of rates in Michigan (0.1 - 6.8 deaths per 1,000 live births);
Light blue: between the mean and mean + one standard deviation of rates in Michigan (6.9 – 15.0 deaths per 1,000 live births);
Dark blue: above the mean + one standard deviation of rates in Michigan (15.1 – 142.9 deaths per 1,000 live births).
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average infant mortality rates by maternal race/ethnicity within prosperity region 7 for 2013-2017. Infant mortality is defined as a death of a baby before his or her first birthday and is expressed as a rate per 1,000 live births. For 2013-2017, there were some differences in infant mortality rates by maternal race and ethnicity within prosperity region 7, from a high of 12.2 deaths per 1,000 live births for Black non-Hispanic women to a low of 0 deaths per 1,000 live births for American Indian women. These statistics are comparable to the overall state rates by race and ethnicity with the exception of American Indian mothers (0 death per 1,000 live births in prosperity region 7 compared to 5.7 deaths per 1,000 live births for the State of Michigan overall).
Infant Mortality Rates by Maternal Age, Prosperity Region 7, 2013-2017 (rate per 1,000 live births)

Infant mortality is defined as a death of a baby before his or her first birthday and is expressed as a rate per 1,000 live births.

Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average infant mortality rates by maternal age within prosperity region 7 for 2013-2017. Infant mortality is defined as a death of a baby before his or her first birthday and is expressed as a rate per 1,000 live births. For 2013-2017, the infant mortality rate for prosperity region 7 was 10.9 deaths per 1,000 live births among women aged less than 20 years, 6.1 deaths per 1,000 live births among women aged between 20 and 29 years, and 5.9 deaths per 1,000 live births among women aged over 30 years. These statistics are comparable to the overall state rates by maternal age.

Infant mortality is defined as a death of a baby before his or her first birthday and is expressed as a rate per 1,000 live births.

Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average infant mortality rates by maternal education within prosperity region 7 for 2013-2017. Infant mortality is defined as a death of a baby before his or her first birthday and is expressed as a rate per 1,000 live births. For 2013-2017, the infant mortality rate for prosperity region 7 was 8.5 deaths per 1,000 live births among women who did not finish high school, 11.0 deaths per 1,000 live births among women who just finished high school, and 4.2 deaths per 1,000 live births among women who had more than a high school education. These statistics are comparable to the overall state rates by maternal education.
Infant Mortality Rates by Payment Source, Prosperity Region 7, 2013-2017 (rate per 1,000 live births)

</table>

Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average infant mortality rates by payment source within prosperity region 7 for 2013-2017. Infant mortality is defined as a death of a baby before his or her first birthday and is expressed as a rate per 1,000 live births. Payment source refers to source of expected payment that pregnant women use at delivery. For 2013-2017, the infant mortality rate for prosperity region 7 was higher among women using Medicaid as the payment source (8.6 deaths per 1,000 live births) than women using private insurance (4.6 deaths per 1,000 live births). This comparison looks very similar when looking at the overall state rates by payment source.
The next several slides contain updated low birthweight statistics for prosperity region 7 in the State of Michigan.
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the incidence of low birthweight within prosperity region 7 from 2010 through 2017. Low birthweight is defined as a birthweight of a baby less than 2,500 grams. The incidence of low birthweight is calculated as the number of low birthweight divided by the number of live births multiplied by 100. The incidence of low birthweight in prosperity region 7 has fluctuated quite a bit over the last eight years, but appears to be on an upward trend since 2014. In 2017, the incidence of low birthweight was 8.8% for the State of Michigan and 8.2% for prosperity region 7.
Low birthweight rate is defined as number of births with baby birthweight < 2,500 grams per 100 live births.

Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average incidence of low birthweight by census tract within prosperity region 7 for 2013-2017. Low birthweight is defined as a birthweight of a baby less than 2,500 grams. The incidence of low birthweight is calculated as the number of low birthweight divided by the number of live births multiplied by 100.

Light green: no live births;
Grey: no low birthweight births;
Yellow: below the mean of rates in Michigan (0.1% - 8.5%);
Light blue: between the mean and mean + one standard deviation of rates in Michigan (8.6% - 12.5%);
Dark blue: above the mean + one standard deviation of rates in Michigan (12.6% - 50.0%).
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average incidence of low birthweight by maternal race/ethnicity within prosperity region 7 for 2013-2017. Low birthweight is defined as a birthweight of a baby less than 2,500 grams. The incidence of low birthweight is calculated as the number of low birthweight divided by the number of live births multiplied by 100. For 2013-2017, there were some differences in the incidence of low birthweight by maternal race and ethnicity within prosperity region 7, from a high of 12.8% for Black non-Hispanic women to a low of 6.7% for White non-Hispanic women. When looking at the State of Michigan as a whole, White non-Hispanic women report the lowest incidence of low birthweight at 7.0% and Black non-Hispanic women report the highest incidence at 14.3%.
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average incidence of low birthweight by maternal age within prosperity region 7 for 2013-2017. Low birthweight is defined as a birthweight of a baby less than 2,500 grams. The incidence of low birthweight is calculated as the number of low birthweight divided by the number of live births multiplied by 100. For 2013-2017, the incidence of low birthweight for prosperity region 7 was 10.4% among women aged less than 20 years, 7.2% among women aged between 20 and 29 years, and 7.9% among women aged over 30 years. These statistics are comparable to the overall state rates by maternal age.

Low birthweight rate is defined as number of births with baby birthweight <2,500 grams per 100 live births.

The next several slides contain updated very low birthweight statistics for prosperity region 7 in the State of Michigan.
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the incidence of very low birthweight within prosperity region 7 from 2010 through 2017. Very low birthweight is defined as a birthweight of a baby less than 1,500 grams. The incidence of very low birthweight is calculated as the number of very low birthweight divided by the number of live births multiplied by 100. The incidence of very low birthweight in prosperity region 7 has remained relatively stable over the last eight years. In 2017, the incidence of very low birthweight was 1.5% for the State of Michigan and 1.2% in prosperity region 7.
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average incidence of very low birthweight by maternal race/ethnicity within prosperity region 7 for 2013-2017. Very low birthweight is defined as a birthweight of a baby less than 1,500 grams. The incidence of very low birthweight is calculated as the number of very low birthweight divided by the number of live births multiplied by 100. For 2013-2017, there were some differences in the incidence of very low birthweight by maternal race and ethnicity within prosperity region 7, from a high of 2.6% for Black non-Hispanic women to a low of 0% for American Indian women. When looking at the State of Michigan as a whole, American Indian women report the lowest incidence of very low birthweight at 1.0% and Black non-Hispanic women report the highest incidence at 3.2%.
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average incidence of very low birthweight by maternal age within prosperity region 7 for 2013-2017. Very low birthweight is defined as a birthweight of a baby less than 1,500 grams. The incidence of very low birthweight is calculated as the number of very low birthweight divided by the number of live births multiplied by 100. For 2013-2017, the incidence of very low birthweight for prosperity region 7 was 1.7% among women aged less than 20 years, 1.3% among women aged between 20 and 29 years, and 1.3% among women aged over 30 years. These statistics are comparable to the overall state rates by maternal age.

Very low birthweight rate is defined as number of births with baby birthweight <1,500 grams per 100 live births.

Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average incidence of very low birthweight by maternal education within prosperity region 7 for 2013-2017. Very low birthweight is defined as a birthweight of a baby less than 1,500 grams. The incidence of very low birthweight is calculated as the number of very low birthweight divided by the number of live births multiplied by 100. For 2013-2017, the incidence of very low birthweight for prosperity region 7 was 1.7% among women who did not finish high school, 1.9% among women who just finished high school, and 1.0% among women who had more than a high school education. These statistics are comparable to the overall state rates by maternal education.
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average incidence of very low birthweight by payment source within prosperity region 7 for 2013-2017. Very low birthweight is defined as a birthweight of a baby less than 1,500 grams. The incidence of very low birthweight is calculated as the number of very low birthweight divided by the number of live births multiplied by 100. Payment source refers to source of expected payment that pregnant women use at delivery. For 2013-2017, the incidence of very low birthweight for prosperity region 7 was higher among women using Medicaid as the payment source (1.7%) than women using private insurance (1.0%). This comparison looks very similar when looking at the overall state rates by payment source.
The next several slides contain updated preterm birth statistics for prosperity region 7 in the State of Michigan.
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the incidence of preterm birth within prosperity region 7 from 2010 through 2017. Preterm birth is defined as a birth of a baby less than 37 completed weeks of gestation. Gestational age is based on the obstetric estimate of gestation. The incidence of preterm birth is based on the number of preterm births divided by the number of live births multiplied by 100. The incidence of preterm birth in prosperity region 7 has remained relatively stable over the last eight years. In 2017, the incidence of preterm birth was 10.2% for the State of Michigan and 9.6% in prosperity region 7.
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average incidence of preterm birth by census tract within prosperity region 7 for 2013-2017. Preterm birth is defined as a birth of a baby less than 37 completed weeks of gestation. Gestational age is based on the obstetric estimate of gestation. The incidence of preterm birth is calculated as the number of preterm births divided by the number of live births multiplied by 100.

Preterm Birth by Maternal Age, Prosperity Region 7, 2013-2017

Average Percent Preterm Birth (Estimated Gestational Age <37 Weeks) by Maternal Age, Prosperity Region 7, 2013-2017

Preterm birth rate is defined as number of births delivered before 37 completed weeks of gestation per 100 live births. Gestational age is based on the obstetric estimate of gestation.

Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average incidence of preterm birth by maternal age within prosperity region 7 for 2013-2017. Preterm birth is defined as a birth of a baby less than 37 completed weeks of gestation. Gestational age is based on the obstetric estimate of gestation. The incidence of preterm birth is calculated as the number of preterm births divided by the number of live births multiplied by 100. For 2013-2017, the incidence of preterm birth for prosperity region 7 was 10.3% among women aged less than 20 years, 8.6% among women aged between 20 and 29 years, and 10.0% among women aged over 30 years. These statistics were slightly lower than the comparable overall state rates by maternal age.
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average incidence of preterm birth by maternal education within prosperity region 7 for 2013-2017. Preterm birth is defined as a birth of a baby less than 37 completed weeks of gestation. Gestational age is based on the obstetric estimate of gestation. The incidence of preterm birth is calculated as the number of preterm births divided by the number of live births multiplied by 100. For 2013-2017, the incidence of preterm birth for prosperity region 7 was 10.8% among women who did not finish high school, 10.9% among women who just finished high school, and 8.4% among women who had more than a high school education. These statistics were slightly lower than the comparable overall state rates by maternal education.
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average incidence of preterm birth by payment source within prosperity region 7 for 2013-2017. Preterm birth is defined as a birth of a baby less than 37 completed weeks of gestation. Gestational age is based on the obstetric estimate of gestation. The incidence of preterm birth is calculated as the number of preterm births divided by the number of live births multiplied by 100. Payment source refers to source of expected payment that pregnant women use at delivery. For 2013-2017, the incidence of preterm birth for prosperity region 7 was higher among women using Medicaid as the payment source (10.9%) than women using private insurance (8.2%). The difference between the Medicaid and private insurance preterm birth percentages is a bit larger in prosperity region 7 when compared to the State of Michigan as a whole.
The next two slides contain updated birth defects prevalence statistics for the State of Michigan as a whole and by Michigan prosperity region.

- Throughout birth years 2006-2016, the birth defect prevalence rate for Michigan remained fairly steady at an average rate of 1,189.3 cases per 10,000 live births.
- In 2016, the race-specific birth defect prevalence rate for cases born to black mothers (1,485.9 cases per 10,000 live births) exceeded that of cases born to white mothers (925.6 cases per 10,000 live births) and cases born to mothers of "other” races (1,372.5 cases per 10,000 live births).
- In 2016, the ethnicity-specific birth defect prevalence rate for cases born to a mother reporting Arabic ethnicity (1,330.1 cases per 10,000 live births) was greater than that of cases born to a mother reporting Hispanic ethnicity (1,016.9 cases per 10,000 live births).

* Total reported birth defect cases for all diagnostic groupings per 10,000 live births
**Maternal Race/ethnicity as reported on birth record

This slide uses data from the Michigan Birth Defects Registry and details the Michigan birth defects prevalence by maternal race and ethnicity for 2016.

The average overall birth defects prevalence for the State of Michigan during 2006-2016 was 1,189.3 cases per 10,000 live births.

In 2016, the birth defects prevalence among black mothers (at 1,485.9 cases per 10,000 live births) and mothers of other races (at 1,372.5 cases per 10,000 live births) was higher than that of white mothers (at 925.6 cases per 10,000 live births).

Furthermore, the birth defects prevalence among Hispanic (at 1,016.9 cases per 10,000 live births) and Arabic mothers (at 1,330.1 cases per 10,000 live births) was greater than that of white mothers (at 925.6 cases per 10,000 live births) in 2016.

Disclaimer: Data are based on passive reporting which means it is the responsibility of facilities to identify and report cases of birth defects. Not all facilities report cases as completely and timely as would be the ideal. Children diagnosed and treated in facilities in other states may be missed which will significantly affect the completeness of data for Michigan’s boarder counties.
Birth Defect Prevalence Rates by Prosperity Region: MBDR, 2016

- The State of Michigan is broken up into 10 prosperity regions based on shared geographic, demographic, and economic interests.
- In 2016, Michigan prosperity regions 6 and 10 reported the highest birth defect prevalence rates of 1,248.1 and 1,411.7 cases per 10,000 live births.
- The prosperity region that reported the lowest birth defect prevalence was region 1 with a prevalence rate of 405.6 cases per 10,000 live births.

***Prevalence rates are based on births to mothers living in Michigan at the time of delivery.
****Regions approximate prosperity region boundaries

This slide uses data from the Michigan Birth Defects Registry and details birth defects prevalence by prosperity region for 2016.

In 2016, regions 10, 6, and 9 reported the highest birth defects prevalence (at 1,411.7, 1,248.1, and 1,201.4 cases per 10,000 live births, respectively), while regions 1, 5, and 3 reported the lowest birth defects prevalence (at 405.6, 550.7, and 600.6 cases per 10,000 live births, respectively).

Disclaimer: Data are based on passive reporting which means it is the responsibility of facilities to identify and report cases of birth defects. Not all facilities report cases as completely and timely as would be the ideal. Children diagnosed and treated in facilities in other states may be missed which will significantly affect the completeness of data for Michigan’s border counties.
Treated Neonatal Abstinence Syndrome (NAS)
Prosperity Region 7, 2010-2016

The next couple slides contain updated treated neonatal abstinence syndrome statistics for prosperity region 7 in the State of Michigan.
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics and Michigan Inpatient Database, this slide shows the incidence of treated neonatal abstinence syndrome (NAS) within prosperity region 7 from 2010 through 2016. Infants with treated NAS were identified by any diagnosis of the International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) diagnosis code of 779.5 (drug withdrawal syndrome in newborn) through September 2015 or Tenth Revision (ICD-10-CM) diagnosis code of P96.1 (neonatal withdrawal symptoms from maternal use of drugs of addiction) starting in October 2015. In 2016, the incidence of neonatal abstinence syndrome in prosperity region 7 was 877.4 per 100,000 live births.

Data source: Michigan Resident Inpatient Files created by the Division for Vital Records and Health Statistics, Bureau of Epidemiology and Population Health, Michigan Department of Health and Human Services, using data from the Michigan Inpatient Database obtained with permission from the Michigan Health and Hospital Association Service Corporation (MHASC).
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average incidence of treated neonatal abstinence syndrome (NAS) by maternal race/ethnicity within prosperity region 7 for 2012-2016. Infants with treated NAS were identified by any diagnosis of the International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) diagnosis code of 779.5 (drug withdrawal syndrome in newborn) through September 2015 or Tenth Revision (ICD-10-CM) diagnosis code of P96.1 (neonatal withdrawal symptoms from maternal use of drugs of addiction) starting in October 2015. In 2012-2016, there were some differences in the incidence of treated neonatal abstinence syndrome by maternal race and ethnicity, from a high of 840.8 per 100,000 live births for Hispanic women to a low of 832.2 for White non-Hispanic women.

Data source: Michigan Resident Inpatient Files created by the Division for Vital Records and Health Statistics, Bureau of Epidemiology and Population Health, Michigan Department of Health and Human Services, using data from the Michigan Inpatient Database obtained with permission from the Michigan Health and Hospital Association Service Corporation (MHASC).
Sleep-Related Infant Death Rate
Michigan, 2010-2017
Prosperity Region 7, 2010-2015

The next couple slides contain sleep-related infant death statistics for prosperity region 7 in the State of Michigan.
Overview of Sleep-Related Infant Deaths in Michigan

- Between 2010 and 2017 there were 1,136 sleep-related infant deaths in Michigan.
- The three-year moving average for sleep-related infant death decreased in 2015-2017, after having experienced an increasing trend for several years.
- Between 2010 and 2016 White infants experience lower sleep-related infant death rates as compared to Black infants and American Indian/Alaska Native infants.
- Between 2010 and 2016 Hispanic and non-Hispanic infants experienced similar sleep-related infant death rates.

Using data from the Michigan Public Health Institute (MPHI), Sudden Unexpected Infant Death (SUID) case registry this slide shows the three-year moving average and sleep-related infant death rate by race/ethnic demographic breakdown. A death is included in the MPHI SUID registry if it occurs in Michigan resident infants less than 1 year of age suddenly and unexpectedly. Sleep-related infant deaths include sudden infant death syndrome (SIDS), undetermined/sudden unexplained infant death (SUID), suffocation/positional asphyxia and other causes where the sleep-environment likely contributed to the death.

The three-year moving average increased from 12.2 per 10,000 live births in 2010 to 2012 to 13.3 per 10,000 live births in 2014 to 2016, before decreasing to 12.5 per 10,000 live births in 2015 to 2017.

Data from 2010 to 2016 show Black infants experience the highest rate of Sudden Unexpected Infant Death (27.6 per 10,000 live births) followed by American Indian and Alaska Native Infants (18.8 per 10,000 live births). White infants experience the lowest rate of Sudden Unexpected Infant Deaths at 9.5 per 10,000 live births.
Between 2010 and 2015 there were 28 sleep-related infant deaths in Region Seven.

Between 2010 and 2015 the sleep-related infant death rate in Region Seven was 8.9 per 10,000 live births.

During this same time period, the Region Seven sleep-related infant death rate was lower than the Michigan sleep-related death rate (12.8 per 10,000 live births).

Using data from the Michigan Public Health Institute, Sudden Unexpected Infant Death (SUID) case registry, this slide shows the sleep-related infant death rate in prosperity region seven as compared to other prosperity regions in the state. Between 2010 and 2015, prosperity region seven experienced a lower SUID rate as compared to Michigan overall, with a rate of 8.9 per 10,000 live births as compared to 12.8 per 10,000 live births for Michigan.
The next slide contains maternal morbidity data for prosperity region 7 in the State of Michigan.
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, Michigan Resident Inpatient files, this slide shows severe maternal morbidity per 10,000 delivery hospitalizations, broken down by race and ethnicity. Severe maternal morbidity includes unexpected outcomes of labor and delivery that result in significant short or long-term health consequences. When looking at prosperity region seven severe maternal morbidity by race, Black mothers experience the highest rate at 187.9 per 10,000 delivery hospitalizations, compared to a rate of 96.7 per 10,000 delivery hospitalizations for region seven overall.

Data source: Michigan Resident Inpatient Files created by the Division for Vital Records and Health Statistics, Bureau of Epidemiology and Population Health, Michigan Department of Health and Human Services, using data from the Michigan Inpatient Database obtained with permission from the Michigan Health and Hospital Association Service Corporation (MHASC).
The next slide contains maternal mortality data for prosperity region 7 in the State of Michigan.
Maternal Mortality Rate, Prosperity Region 7, 2011-2015
(rate per 100,000 live births)

- Maternal deaths include deaths that occur during pregnancy, at delivery or within one year of pregnancy.
- Total maternal mortality includes both pregnancy associated mortality (unrelated to the pregnancy) and pregnancy-related mortality (related to or aggravated by the pregnancy).
- In Region Seven there were 10 maternal deaths between 2011 and 2015.
- The resulting maternal mortality rate equals 38.1 per 100,000 live births.

Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics and the Michigan Department of Health and Human Services, Michigan Maternal Mortality Surveillance Program, this slide shows the maternal mortality rate in prosperity region seven as compared to the rest of the prosperity regions in Michigan. Maternal mortality is classified as a death that occurs during pregnancy or within one year of pregnancy. Prosperity region seven experiences a lower maternal mortality rate than Michigan overall at 38.1 per 100,000 live births as compared to 59.7 per 100,000 live births for Michigan.
Maternal Depression
Michigan & Prosperity Region 7, 2012-2015

The next few slides contain maternal depression data for prosperity region 7 in the State of Michigan.
Using data from the Michigan Department of Health and Human Services Pregnancy Risk Assessment Monitoring System (MI PRAMS), the following slides show the prevalence of depression before and after pregnancy by maternal race/ethnicity. Numbers are reported as the proportion of mothers of live births reporting a certain condition. Birth years 2012-2015 are combined to provide more precision for subgroup estimates.

For the state as a whole: 8.9% of mothers report depression before pregnancy but no postpartum depression; 3.8% reported depression before pregnancy and postpartum depression; and 9.5% reported postpartum depression but no depression before pregnancy. The top two numbers in each bar added together are the proportion of women reporting postpartum depression. For the state as a whole, 9.5% + 3.8% = 13.3% of women report depression after pregnancy.

Notably - most women who report postpartum depression did not report depression before pregnancy. Most women who reported depression before pregnancy did not go on to report postpartum depression.

A small proportion of mothers reported depression both before and after pregnancy. There is variation by maternal race/ethnicity. Depression before pregnancy is relatively more common among NHW mothers than NHB mothers. Depression after pregnancy is relatively more common among mothers of NHB and Other race/ethnicity compared to NHW mothers.
Depression by time [before pregnancy only, after pregnancy only, both] is available for sub-state prosperity regions.

Postpartum depression (top two numbers per column) is relatively less common among mothers in prosperity region 9 and is more common among mothers in prosperity region 10. This difference in prosperity region 10 is being driven by significantly more postpartum depression in Wayne County (data not shown).

Due to small numbers in each region, few differences are statistically significant. The most important thing to take from this slide is that no region of the state is without maternal depression before and after pregnancy.
Looking at women reporting depression either before pregnancy and/or after pregnancy:

Between one quarter and one fifth of all Michigan mothers are affected by depression (22.2%).

By maternal race/ethnicity:
About one fifth of NHW mothers (20.8%) are affected by depression around the time of pregnancy.
About one quarter of NHB (25.6%) or other race/ethnicity (25.6%) mothers are affected by depression.

The most important thing to take from this slide is that a considerable proportion of mothers of all race/ethnicities are affected by depression either before pregnancy, after pregnancy, or at both times.
Looking at women reporting depression either before pregnancy and/or after pregnancy:

Between one quarter and one fifth of all Michigan mothers are affected by depression (22.2%).

Depression may be relatively more common among mothers of prosperity region 2, but the difference may be attributable to chance (p=0.0504). Depression was relatively less common among mothers of prosperity region 9 (p=0.0383) and prosperity region 10 (p=0.0051). The difference for prosperity region 10 is being driven by less overall depression among mothers of Oakland County (data not shown).

The most important thing to take from this slide is that a considerable proportion of mothers in all prosperity regions are affected by depression either before pregnancy, after pregnancy, or at both times.
The next two slides contain updated stillbirth rate statistics for prosperity region 7 in the State of Michigan.
Stillbirth Rate, Prosperity Region 7, 2010-2017
(rate per 1,000 live births + stillbirths)

Stillbirth Rate (per 1,000 Live Births & Stillbirths),
Michigan and Prosperity Region 7, 2010-2017

Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the stillbirth rates within prosperity region 7 from 2010 to 2017. Within the remaining slides, stillbirths are defined as a death of a fetus that has completed at least 20 weeks of gestation or weighs at least 400 grams, and the rate is expressed per 1,000 live births and stillbirths. In 2017, the stillbirth rate was 5.4 per 1,000 live births and stillbirths for the State of Michigan and 4.8 per 1,000 live births and stillbirths in prosperity region 7.
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average stillbirth rates by maternal race/ethnicity within prosperity region 7 in 2013-2017. A stillbirth is defined as a death of a fetus that has completed at least 20 weeks of gestation or weighs at least 400 grams, and the rate is expressed per 1,000 live births and stillbirths. For 2013-2017, there were some differences in the average stillbirth rates by maternal race and ethnicity, from a high of 8.5 per 1,000 live births and stillbirths for Black non-Hispanic women to a low of 4.3 per 1,000 live births and stillbirths for White non-Hispanic and Asian/Pacific Islander women for the State of Michigan, and from a high of 9.4 per 1,000 live births and stillbirths for Black non-Hispanic women to a low of 4.7 per 1,000 live births and stillbirths for White non-Hispanic women within prosperity region 7.
Breastfeeding Initiation and Duration,
Prosperity Region 7

The next couple slides contain breastfeeding initiation and duration data for prosperity region 7 in the State of Michigan.
Compared to mothers in the remainder of Michigan, significantly mothers of prosperity region 7 initiate breastfeeding and continue for at least 4, 8, and 12 weeks postpartum.
Didn’t Plan to Breastfeed by Census Tract, Prosperity Region 7, 2013-2017

Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average percentage of mothers who didn’t plan to breastfeed by census tract within prosperity region 7 for 2013-2017. This indicator is calculated as the percentage of mothers who did not plan to breastfeed their babies at delivery among all live births.

Light green: no live births;
Grey: 0.0% of mothers who didn’t plan to breastfeed;
Yellow: below the mean of rates in Michigan (0.1% - 18.5%);
Light blue: between the mean and mean + one standard deviation of rates in Michigan (18.6% - 30.2%);
Dark blue: above the mean + one standard deviation of rates in Michigan (30.3% - 100.0%).
The next couple slides contain information on reasons why Michigan mothers did not initiate breastfeeding.
The majority of Michigan mothers initiated breastfeeding in 2016 (84.0%) and 2017 (87.3%). Women who did not initiate breastfeeding were directed to select specific reasons (from among nine possible choices) that they did not breastfeed. The numbers reported here are the proportion of all mothers who did not initiate breastfeeding.

The two most commonly cited reasons that mothers did not initiate breastfeeding were - mom did not want to breastfeed, and mom did not like breastfeeding.
When comparing the reasons for not initiating breastfeeding among non-Hispanic white and non-Hispanic black mothers, there are few differences [two of nine possible reasons] that rise to the level of statistical significance. NHB mothers were significantly more likely than NHW mothers to cite not liking breastfeeding and trying breastfeeding but it was too hard.

The most prevalent reason overall (mom did not want to breastfeed) is also the top reason for both subgroups of mothers.
Gestational Hypertension, Prosperity Region 7, 2013-2017

The next slide contains updated gestational hypertension statistics for prosperity region 7 in the State of Michigan.
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average incidence of gestational hypertension by maternal race/ethnicity within prosperity region 7 for 2013-2017. The incidence of gestational hypertension is calculated as the number of women who had gestational hypertension divided by the number of live births multiplied by 100. For 2013-2017, there were some differences in the incidence of gestational hypertension by maternal race and ethnicity, from a high of 7.3% for American Indian women to a low of 3.9% for Asian/Pacific Islander women for the State of Michigan, and from a high of 8.6% for Black non-Hispanic women to a low of 3.9% for Asian/Pacific Islander women within prosperity region 7.
Gestational Diabetes,
Prosperity Region 7, 2012-2015

The next slide contains updated gestational diabetes statistics for prosperity region 7 in the State of Michigan.
PRAMS asks two questions about diabetes - whether a mother had diabetes before pregnancy, and whether she developed gestational diabetes during her pregnancy. The numbers reported here are women who answered that they developed gestational diabetes (GDB) during pregnancy - excluding a small number of women who had already answered that they also had diabetes before pregnancy.

Gestational diabetes is no more or less common among the mothers of prosperity region 7 than the rest of the state.

At the state level, GDB incidence increases with increasing maternal age group. GDB is also about twice as common among women with a family history (father, mother, sister, brother) of diabetes. GDB may be more common among mothers of non-Hispanic Asian/Pacific Island ancestry.
Short Interpregnancy Interval, Prosperity Region 7, 2012-2015

The next slide contains short interpregnancy interval statistics for prosperity region 7 in the State of Michigan.
Interpregnancy interval (IPI) is estimated from the Michigan Department of Health and Human Services Pregnancy Risk Assessment Monitoring System (MI PRAMS). Because PRAMS does not have the end date of mother’s last pregnancy (whether it ended in a stillbirth, miscarriage, or termination), IPI here is calculated by counting the number of months between mother’s last live birth and her date of last menstrual period before this pregnancy. Thus technically the PRAMS estimate of IPI is an inter-live-birth interval.

Short IPI is defined as less than 18 months elapsed since mother’s last live birth. The denominator is the proportion of Michigan mothers who have had a prior live birth. Birth years 2012-2015 are combined to provide more precision for subgroup estimates.

Short IPI is no more or less common among prosperity region 7 mothers compared to mothers in the rest of the state.
The next few slides contain updated smoking during pregnancy statistics for prosperity region 7 in the State of Michigan.
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average incidence of smoking during pregnancy by maternal race/ethnicity within prosperity region 7 for 2013-2017. The incidence of smoking during pregnancy is calculated as the number of women who smoked during pregnancy divided by the number of live births multiplied by 100. For 2013-2017, there were some differences in the incidence of smoking during pregnancy by maternal race and ethnicity, from a high of 45.8% for American Indian women to a low of 2.9% for Asian/Pacific Islander women for the State of Michigan, and from a high of 39.6% for American Indian women to a low of 3.8% for Asian/Pacific Islander women within prosperity region 7.
Using data from the Michigan Department of Health and Human Services, Division for Vital Records and Health Statistics, this slide shows the average incidence of smoking during pregnancy by census tract within prosperity region 7 for 2013-2017. The incidence of smoking during pregnancy is calculated as the number of women who smoked during pregnancy divided by the number of live births multiplied by 100.

- Light green: no live births;
- Grey: no smoking during pregnancy;
- Yellow: below the mean of rates in Michigan (0.1% - 19.7%);
- Light blue: between the mean and mean + one standard deviation of rates in Michigan (19.8% - 32.0%);
- Dark blue: above the mean + one standard deviation of rates in Michigan (32.1% - 100.0%).
Smoking data calculated from the Michigan Department of Health and Human Services Pregnancy Risk Assessment Monitoring System (MI PRAMS). Numbers are reported as the proportion of mothers of live births reporting any cigarette smoking or whether smoking was allowed in their home during pregnancy. Birth years 2012-2015 are combined to provide more precision for subgroup estimates.

Smoking around pregnancy is a concern everywhere in the state. However smoking around pregnancy is no higher or lower in prosperity region 7 than in the rest of MI.
In addition to looking at overall prevalence for smoking at different time periods, MI PRAMS can also report changes in smoking for each mom and describe those changes collectively.

At the state level, about half of pre-pregnancy smokers stop smoking by the last 3 months of pregnancy. No region differs significantly for quitting smoking during pregnancy.

At the state level, 43% of those who quit smoking during pregnancy resume smoking afterwards. Prosperity region 7 though has fewer moms who resumed smoking after pregnancy (p<0.0001) than any other region.
