

# HIV Among Women, Infants, Children & Youth (WICY)

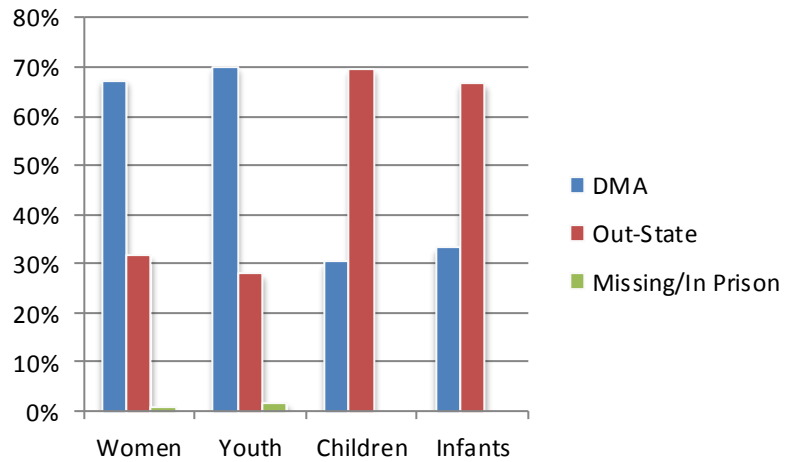

**Figure 1. HIV prevalence by WICY category**

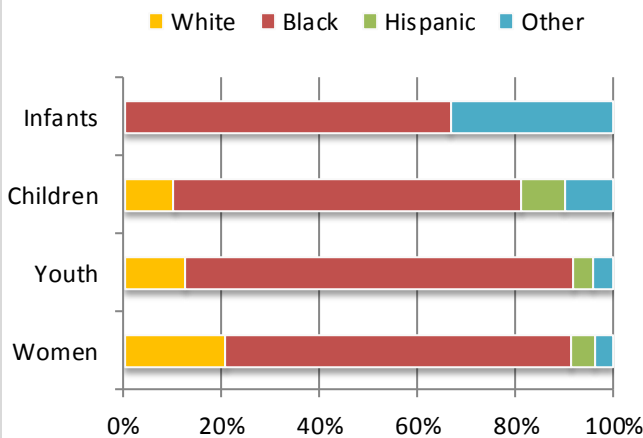

- Women (25+ years old) comprised over three-fourths of the total number of HIV cases among WICY.
- Youth (13-24 years old) made up the second largest proportion of all WICY cases (21%).
- Children (2-12 years old) represented just 67 of 4,418 WICY cases or about 2 percent of all WICY cases.
- Infants (under 2 years old) made up the smallest percentage of WICY cases (<1%).

**Figure 2. WICY currently living with HIV infection by region**

- The majority of women (67%) and the majority of youth (70%) currently reside in the DMA.
- Inversely, the majority of children (70%) and the majority of infants (67%) currently reside in Out-state Michigan.
- A small proportion of cases among women and youth were diagnosed in prison (<1%).

**Figures 3 & 4. WICY currently living with HIV infection by race and risk**

- The majority of all WICY currently living in Michigan are black (71% of women, 79% of youth, 71% of children, 67% of infants)
- Twenty-one percent of cases among women are white.

- Sixty-nine percent of women living with HIV have infections attributed to heterosexual contact.
- Almost two-thirds of youth were infected via men who have sex with men behavior including MSM/injection drug users (IDU).
- The majority of children (71%) and all infants were infected perinatally.
