A Proposal to Expand the Calibration Research Agenda: Part Two

Presentation to Energy Optimization Collaborative

October 2015

DTE Energy

Consumers Energy
Count on Us

NAVIGANT
ENERGY

CADMUS

EMI CONSULTING

Agenda

1. Expand Collaborative Research Proposal
2. EO Collaborative Feedback
3. Next Steps
4. EO Collaborative Homework: Submit Research Ideas
5. EO Collaborative Discussion
6. Appendix: Research Study Summaries

September EO Collaborative Meeting Recap

State of MEMD Calibration

- Calibration has occurred for 70-80% of historical portfolio savings
- Most of the large savings measures have been addressed
- New measures introduced into the MEMD are subjected to a rigorous review and often utilize calibration research for key inputs to savings calculations

Proposal to Expand Collaborative Research Agenda

- Expand research framework to include other opportunities
    - Industry leadership and innovation
    - Deployment of best practices
    - Establishment of compliance paths with federal or state policies
- Identify, prioritize, and deploy joint research initiatives
- Seek EO Collaborative input on research ideas and approaches

Initial Collaborative Feedback

- Very interested in exploring a broader calibration research agenda
- Interested in better understanding potential Clean Power Plan and Michigan energy legislation implications on collaborative research
- Interest in research that includes, but also extends beyond DTE Energy and Consumers Energy territory (i.e. UP or analysis that shows differences between more rural parts of state versus more densely populated)
- Open to developing an EO Collaborative sub-committee to identify key collaborative research needs

Proposed Next Steps

1. Identify
   - Identify collaborative research opportunities with input from members of the EO Collaborative
2. Prioritize
   - Develop a sub-committee to refine prioritization criteria and prioritize opportunities
3. Screen
   - Sub-committee to review and screen research ideas for high impact opportunities
4. Select
   - Sub-committee will select research study with input from EO Collaborative

Proposed Timeline

Timeframe	Topic
October EO Collaborative	Review proposal, next steps, and solicit feedback from EO Collaborative on additional collaborative research ideas
October – December (2- 3 times as needed)	Hold sub-committee working group sessions to discuss study prioritization, rankings, and finalize key research topics
December or January EO Collaborative	Present key research topics developed by sub-committee and select final study with input from EO Collaborative

EO Collaborative Homework

1. Review proposed collaborative research opportunities
2. Identify and prepare a short summary of additional collaborative research opportunities, including:
   - Study objectives
   - Research approach
   - Key considerations
3. Complete research topic template and submit to Dave Walker (MPSC staff) before or during October EO Collaborative meeting

EO Collaborative Homework

[Research Topic]

Objectives	• [Collaborative research study key objectives]	
Research Approach	• [Collaborative research study high-level research approach]	
Considerations: + and –	[Favorable considerations for research study]	[Unfavorable considerations for research study]

Collaborative Feedback (Discussion & Decision)

- Proposed process and formation of sub-committee
- Discussion of collaborative research ideas, proposed and additional

Collaborative Research Ideas

Residential LED Net-to-Gross Research	Emerging Technology Studies	Baseline Study
What is the DTE/Consumers program influence or program-attributable sales of LED program-incented bulbs?	What are potential emerging technologies in MI? What is holding adoption back? What can be done to further advance these technologies?	What is the current saturation of baseline and energy efficient measures? What is the current market share of high efficiency energy consuming equipment?
Market Transformation Research	**Program-Specific Research Studies**	**Issue-Specific Research Studies**
What has been the impact of driving the market and adoption of emerging measures, outside of direct participation in a utility rebate program?	Are there any program-specific challenges across utilities that could benefit from further research?	For example: A joint study related to 111(d)planning/compliance options, related directly to the role of EE.
Income Qualified Research	**Gas Measure Savings Study**	**Potential Analysis**
Assess the baseline for the income-qualified housing stock in order to assess the savings potential. Assess bill savings and arrearage impacts of income-qualified projects.	Identify new gas measures that can be adopted to address uncertainty in gas portfolio. What other strategies may Michigan's largest gas consumers employ?	What is the residential and commercial technical, economic and program potential for efficiency in Michigan based on current saturation of baseline and energy efficient measures?

MEMD Measure Calibration

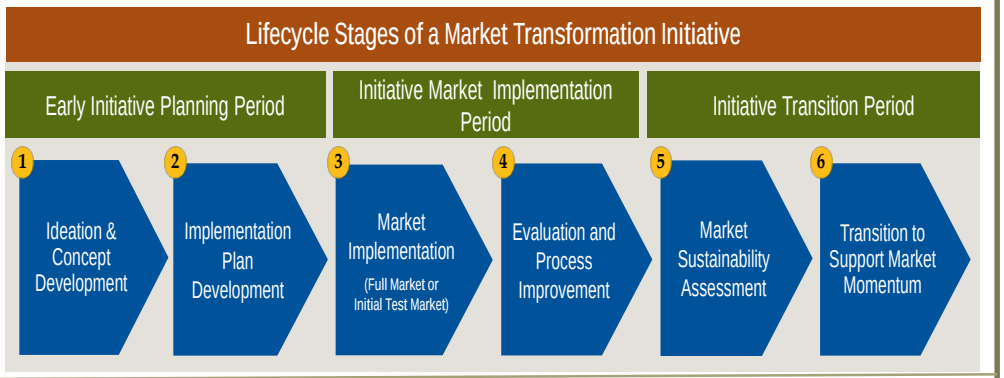
Objectives	Ensure MEMD savings values, within an acceptable level of precision, represent the actual energy savings being realized through measure installation.

Research Approach	• Review and prioritize MEMD measures based on past evaluations and upcoming program plans
	• Calibration efforts vary by measures but can include:
	  • Collecting primary data collection via metering/on-sites (high cost)
	  • Leveraging existing evaluation data (low cost)

Considerations: + and –	+ • Established protocol with MPSC and other stakeholders, provides assurance to interveners • MEMD measures account for the majority of savings currently realized through the EO programs – • A majority of measures have been calibrated during the EO program five year history -> future studies are calibrating measures at the margins • Expensive research efforts

Market Transformation

Objectives	• Develop framework for attribution for market transformation resulting from utility programs and efforts. • Develop methodology for forecasting baseline changes without utility programs and attribution for improvements above the forecasted baseline. • Identify high potential technologies and end-uses where combined Michigan utility programs are likely to transform the market.
Research Approach	1. Develop frame work 2. Identify key transformation opportunities 3. Develop methodology for attribution
Considerations: + and –	All utility energy efficiency programs seek to cause long-term and lasting change in the market for energy efficiency. Market transformation requires concerted and coordinated efforts from all utilities in the state. A framework and metrics for attribution is required so that the utilities can fund and pursue market transformation. Market transformation may be driven by many exogenous factors. Attribution may be hotly contested. DTE and Consumer's have ongoing work in this area, so there may be duplication. Some commissions have been unwilling to accept and support market transformation attribution.



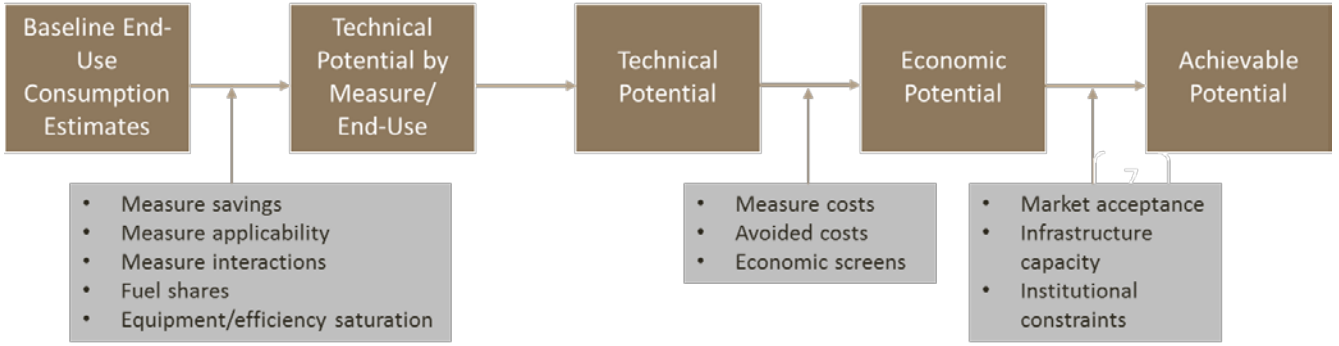
Statewide Potential Analysis

Objectives

Forecast of technical, economic, and achievable energy efficiency potential in the state based on:

- Current use of energy
- Expected economic conditions
- Available efficient technology performance and cost
- Market acceptance and adoption of efficient technologies

Research Approach



Considerations: + and –

+ Common assessment of potential will guide establishment of savings targets, further refinement of the MEMD, collaborative program opportunities. Modest investment if recent baseline research has been conducted and a robust technology database exists.

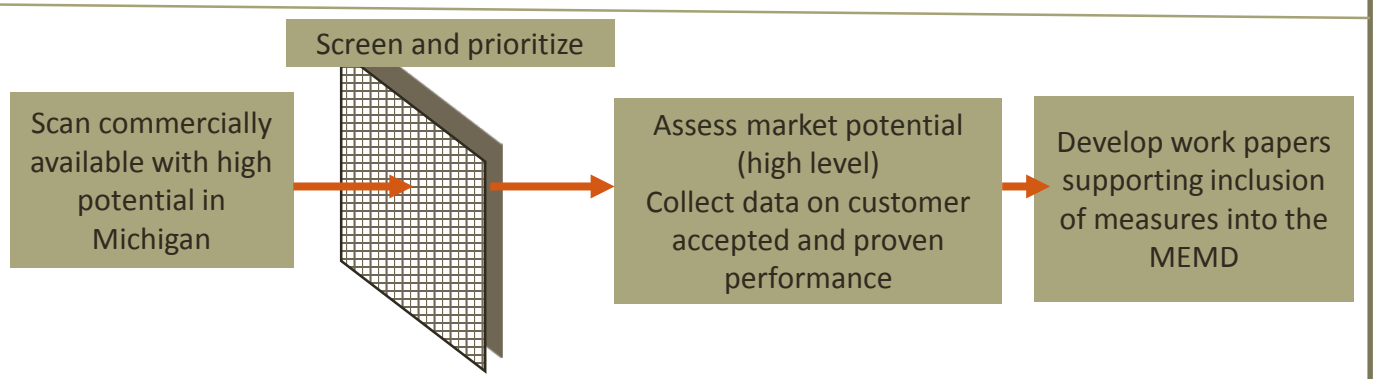
– A statewide study may not support individual utility Integrated Resource Plan development. Recent statewide baseline data is required for the study.

Emerging Technologies

Objectives

- Identify and characterize commercialized emerging energy efficiency technologies that offer significant potential in Michigan for savings in the 2017 to 2020 time frame.
- For high potential technologies, develop work papers supporting savings values for inclusion in the MEMD.

Research Approach



Considerations: + and –

+

With changing baselines, it is becoming increasingly difficult to meet energy savings goals with established technologies. There are multiple emerging, commercialized technologies with high savings. Collaborative research on identifying and qualifying these measures could reduce costs and accelerate acceptance into utility programs.

–

DTE and Consumer's have ongoing work in this area, so there may be duplication. The technologies may not have sufficiently demonstrated performance to warrant inclusion in the MEMD. Many emerging technologies include controls and behavior components and may be not be suitable for a deemed or "a calculated deemed" value.

Issue Specific Research

Objectives	• Explore topics related to energy efficiency potential, program design and implementation, state or federal policies that impact implementation • Generate common understanding of current issues that impact energy efficiency program implementation.	
Research Approach	• Would vary depending on topic but would likely include literature review, stakeholder and/or technical expert interviews, scenario development, and summary reporting.	
Considerations: + and –	Collaborative research on key topics would allow provide an unbiased review of key topics. The collaborative research model would allow consolidation of resources to examine multiple perspectives of key issues.	Some of the issues impacting energy efficiency are complex and evolving; this may make it difficult to conduct discrete research on a topic that remains relevant for a significant length of time.
