

# SITE INVESTIGATION REPORT

ABANDONED MINING WASTES – TORCH LAKE NON-SUPERFUND SITE  
QUINCY MINING COMPANY PORTAGE OPERATIONS AREA  
HOUGHTON COUNTY, MICHIGAN  
SITE ID# 31000098

APRIL 2024

PREPARED FOR:

**MICHIGAN DEPARTMENT OF ENVIRONMENT, GREAT LAKES, AND ENERGY**  
REMEDIATION AND REDEVELOPMENT DIVISION  
CALUMET FIELD OFFICE

## EXECUTIVE SUMMARY

The Mannik & Smith Group, Inc. (MSG) has prepared this Site Investigation (SI) Report as part of the Abandoned Mining Wastes – Torch Lake non-Superfund Site (Project) [EGLE Abandoned Mining Waste](#) (Site ID: 31000098). This report summarizes Michigan Department of Environment, Great Lakes, and Energy (EGLE) investigations completed in the Quincy Mining Company Portage Operations Area (QMCP), Houghton County, Michigan. The SI was prepared in accordance with the *Indefinite Scope Indefinite Delivery (ISID) Discretionary Proposal for FS and Remedial Action Activities* (24 February 2016) as amended, prepared by MSG in response to a request from the EGLE, Remediation and Redevelopment Division (RRD), Calumet Field Office under MSG's 2015 Environmental Services ISID Contract Number 00538 with the State of Michigan.

The Project was characterized by the risks posed by chemical containers and residues historically discarded in or near Torch Lake and along the north shoreline of the Portage Canal. These concerns are distinct and separate from the risks historically addressed under the U.S. Environmental Protection Agency's (EPA's) Superfund program. The RRD Superfund Section (SFS) has stated that the EPA defines the Torch Lake Superfund Site as the upper six inches (in.) of stamp sand and slag in certain areas of Houghton County and any soil cap and vegetative cover applied to such areas.

The remaining concerns at Torch Lake, the Portage Canal, and the surrounding areas identified by EGLE included known or suspected impacts to groundwater, surface water, sediments, and upland media that were not addressed under the Superfund program. Environmental impacts that were evaluated as part of the SI were assessed under the guidance of the following objectives:

- Investigate and document unidentified, significant in-lake and/or terrestrial sources of contamination including polychlorinated biphenyls (PCBs);
- Investigate and document bulk disposal areas, including made lands, stamp sand deposits, slag dumps, and landfills; and,
- Investigate and document industrial ruins including coal storage areas, underground storage tanks (USTs), asbestos containing materials (ACM), residual process materials (RPM), and any other waste materials identified during investigations.

Environmental impairments within Torch Lake and along the shorelines from Lake Linden to the Portage Lake Lift Bridge resulting from historical mining era industrial operations:

- Present potential exposure risk to human and ecological receptors;
- Limit the recovery of the Torch Lake and Portage Canal ecosystems;
- Create uncertainty over safe and beneficial reuse of the land; and,
- Delay delisting of Torch Lake as an Area of Concern (AOC) under the Great Lakes Water Quality Agreement due to Beneficial Use Impairments (BUIs) related to restrictions on fish and wildlife consumption because of the on-going presence of PCBs and mercury in fish and degradation of benthos because of metals contaminated sediments.

As such, the investigation was largely driven by documented observations of abandoned containers and/or other waste and debris locations in water bodies and in upland areas, supported by documented historic operations.

Taking into account the specific objectives outlined above, the principal goal of this portion of the Project was to support a comprehensive management approach to guide EGLE's decision making process in addressing potential human health and environmental risks present in the QMCP. The primary focus of the Project was to ascertain the source, nature, and extent of contaminants (including PCBs) in all affected environmental media (soil, groundwater, surface

water, and sediments) within the Project study area, including the QMCP that consists of the former mining era industrial areas from the Portage Lake Lift Bridge in Hancock to Dollar Bay along the north shoreline of the Portage Canal. Refer to **Figure 1-1, Project Location Map**. Due to the varying nature of historical operations within the QMCP, subareas addressed as part of this SI work were as follows:

- Area A;
- Area B;
- Area E;
- Area F;
- Area H;
- Area J;
- Area K
- Area M;
- Area O; and,
- Area P.

The locations of the listed subareas are depicted on **Figure 1-2, Area Features Map**.

This SI Report assimilates information from multiple data sources into a logical and thorough narrative focused on the north side of the Portage Canal from the Portage Lake Lift Bridge to Dollar Bay. This area, defined in the document as the QMCP, encompasses the former Quincy Mining Company (QMC) copper mining and processing operations and includes certain mining era industrial facilities in Dollar Bay and on the Ripley Waterfront along the Portage Canal. The findings presented herein were developed using the conclusions derived from historical operations research, investigation and response activities, and the investigation of data gaps or known or suspected impacts to groundwater, surface water, sediments, and upland media in and around the north side of the Portage Canal.

Due to the sizeable nature of the QMCP, this SI Report has been organized to present organizational and procedural steps that were common to the investigation in the first four sections of the document. Following these discussions that are broadly applicable to the Project as a whole, the SI Report transitions to a presentation of detailed findings specific to a subset of the upland and in-lake subareas within the QMCP. Remaining subareas addressed as part of the Project within the QMCP footprint are discussed in other SI reports. The SI Report then closes with a comprehensive summary of conclusions and recommendations. The following provides a brief overview of the SI Report's organization.

**Section 1** of this SI Report defines the overall objectives and the organizational structure of the Project. **Section 2** provides Project background information and its significance as it relates to each of the study areas included in the QMCP. **Section 3** provides a summary of the stepwise approach used to evaluate historical operational and analytical data, and its incorporation into the field procedures and sample collection activities prescribed in the Sampling and Analysis Plan (SAP) for the Project. **Section 4** includes a summary of the relevant exposure criteria and pathways used to evaluate the analytical findings from the investigation. **Section 5** through **Section 15** provide detailed findings including figures and tables summarizing analytical results for the QMCP. **Section 16** includes a summary of conclusions and recommendations. **Section 17** includes references utilized in the development of this SI Report.

The submittal of the QMCP SI Report marks a significant milestone in the assessment and remediation of environmental impairments within the Portage Canal and industrial areas along the shoreline caused by historical mining and industrial operations not addressed under the EPA Superfund Program.

Environmental impacts in the QMCP are generally characterized by detections of organic and inorganic contaminants in soil, sediment, groundwater, and pore water; repercussions of mining era operations in the region. The following

provides a summary of findings derived from the assessment of the QMCP with respect to the goals and objectives for the Project relative to the EGLE criteria at the time of Project completion:

- Terrestrial sources of contamination are present in the form of inorganic chemicals of concern (COCs), semi-volatile organic compounds (SVOCs), volatile organic compounds (VOCs), and cyanide in the study area;
- In-lake sources of contamination are present in the form of inorganic COCs and SVOCs in the study area sediments and some areas of pore water. The detection of SVOCs in at least certain locations may be indicative of terrestrial source areas;
- No in-lake or terrestrial uncharacterized waste deposits were identified in the study area;
- PCBs were only detected at one location (in Area J) and no samples analyzed for PCBs exceeded EGLE criteria in the study area;
- ACM was not identified in the study area; and,
- Industrial ruins, including foundations and building floors associated with mill ruins are present. Uneven terrain, structure remnants, and metal debris pose a potential physical hazard due to slip, trip, and fall concerns.

The Project provided a comprehensive evaluation of the terrestrial and Portage Canal portions of the QMCP study area. By copy of this SI report, the Project findings have been provided to the other governmental stakeholders responsible for implementation and monitoring EPA's remedy for the Torch Lake Superfund Site so they can determine if any remedy modifications are necessary in the Portage Canal or terrestrial areas previously addressed by EPA in light of the additional information provided by the Project. The stakeholders include various EPA programs, health agencies, other EGLE divisions, property owners, and other governmental entities.

Next steps specific to QMCP include:

- Owners of property that was previously used for industrial or waste disposal purposes in the study area should become familiar with the conditions present at their property and undertake measures to prevent exacerbation of conditions and prevent third-parties, including trespassers, from being exposed to hazards that may be present on their property. This report serves as a helpful base for that information.
- EGLE Superfund staff should continue to monitor properties where a vegetated cap has been constructed and institutional controls, where required, have been recorded and are being enforced.

| 3.1 PLANNING AND COORDINATION.....                                                                    | 3-1        |
| 3.1.1 Historical Research and Data Compilation.....                                                   | 3-1        |
| 3.1.2 Data Compilation Technical Memorandum .....                                                     | 3-1        |
| 3.1.3 Offshore Mapping and Procedural Testing.....                                                    | 3-2        |
| 3.1.4 Sampling and Analysis Plan Development.....                                                     | 3-3        |
| 3.2 FIELD PROCEDURES AND SAMPLE COLLECTION .....                                                      | 3-5        |
| 3.2.1 Potential Physical and Health Hazard Inventory .....                                            | 3-5        |
| 3.2.2 Bulk Material Sampling .....                                                                    | 3-6        |
| 3.2.3 Surface Soil Sampling .....                                                                     | 3-6        |
| 3.2.4 Subsurface Soil Sampling .....                                                                  | 3-6        |
| 3.2.5 Groundwater Sampling .....                                                                      | 3-7        |
| 3.2.6 Sediment Sampling .....                                                                         | 3-8        |
| 3.2.7 Decontamination Procedures and Management of Investigative Derived Wastes .....                 | 3-8        |
| 3.2.8 Sample Handling, Tracking, and Custody Procedures.....                                          | 3-9        |
| 3.2.9 QA/QC.....                                                                                      | 3-10       |
| <b>4. EXPOSURE ASSESSMENT .....</b>                                                                   | <b>4-1</b> |
| 4.1 EGLE FACILITY DEFINITION.....                                                                     | 4-1        |
| 4.2 APPLICABLE SCREENING CRITERIA.....                                                                | 4-2        |
| 4.2.1 Non-Evaluated Exposure Pathways.....                                                            | 4-3        |
| 4.2.2 Non-Applicable Exposure Pathways .....                                                          | 4-3        |
| 4.2.3 Relevant Exposure Pathways Where Applicable Criteria Are Not Exceeded.....                      | 4-3        |
| 4.2.4 Relevant Exposure Pathways Where Criteria Are Exceeded, But Pathway Is Incomplete.....          | 4-3        |
| 4.2.5 Relevant Exposure Pathways Where Applicable Criteria Are Exceeded and Pathway is Complete ..... | 4-4        |

|           |                                                                                                                               |            |
|-----------|-------------------------------------------------------------------------------------------------------------------------------|------------|
| 4.2.6     | Relevant Cleanup Criteria for Hazardous Substances in Contaminated Environmental Media Not Accounted for by Other Rules ..... | 4-5        |
| 4.3       | CONCEPTUAL SITE MODEL .....                                                                                                   | 4-5        |
| <b>5.</b> | <b>DETAILED FINDINGS – AREA A .....</b>                                                                                       | <b>5-1</b> |
| 5.1       | SITE INSPECTION AND INVESTIGATION RESULTS .....                                                                               | 5-1        |
| 5.1.1     | Site Inspection.....                                                                                                          | 5-1        |
| 5.1.2     | Site Investigation.....                                                                                                       | 5-1        |
| 5.2       | NATURE AND EXTENT OF CONTAMINATION .....                                                                                      | 5-2        |
| 5.2.1     | Comprehensive Exposure Assessment .....                                                                                       | 5-2        |
| 5.2.2     | Extent of Contamination .....                                                                                                 | 5-6        |
| 5.3       | CONCLUSIONS AND RECOMMENDATIONS .....                                                                                         | 5-7        |
| 5.3.1     | Conclusions.....                                                                                                              | 5-7        |
| 5.3.2     | Recommendations .....                                                                                                         | 5-8        |

# 1. INTRODUCTION

The Mannik & Smith Group, Inc. (MSG) has prepared this Site Investigation (SI) Report as part of the Abandoned Mining Wastes – Torch Lake non-Superfund Site (Project) [EGLE Abandoned Mining Waste](#) (Site ID: 31000098). This report summarizes Michigan Department of Environment, Great Lakes, and Energy (EGLE) investigations completed in the Quincy Mining Company Portage Operations Area (QMCP), Houghton County, Michigan.

The SI was prepared in accordance with the *Indefinite Scope Indefinite Delivery (ISID) Discretionary Proposal for FS and Remedial Action Activities* (24 February 2016) as amended, prepared by MSG in response to requests from the EGLE, Remediation and Redevelopment Division (RRD), Calumet Field Office under MSG's 2015 Environmental Services ISID Contract Number 00538 with the State of Michigan.

This SI Report assimilates information from multiple data sources into a logical and thorough narrative focused on the north side of the Portage Canal from the Portage Lake Lift Bridge to Dollar Bay. This area, defined in the document as the QMCP, encompasses the former Quincy Mining Company (QMC) copper mining and processing operations and includes certain mining era industrial facilities in Dollar Bay and on the Ripley Waterfront along the Portage Canal. The findings presented herein were developed using the conclusions derived from historical operations research, investigation and response activities, and the investigation of data gaps or known or suspected impacts to groundwater, surface water, sediments, and upland media in and around the north side of the Portage Canal.

Due to the sizeable nature of the QMCP, this SI Report has been organized to present organizational and procedural steps that were common to the investigation in the first four sections of the document. Following these discussions that are broadly applicable to the Project as a whole, the SI Report transitions to a presentation of detailed findings specific to a subset of the upland and in-lake subareas within the QMCP. Remaining subareas addressed as part of the Project within the QMCP footprint are discussed in other SI reports. The SI Report then closes with a comprehensive summary of conclusions and recommendations. The following provides a brief overview of the SI Report's organization.

**Section 1** of this SI Report defines the overall objectives and the organizational structure of the Project. **Section 2** provides Project background information and its significance as it relates to each of the study areas included in the QMCP. **Section 3** provides a summary of the stepwise approach used to evaluate historical operational and analytical data, and its incorporation into the field procedures and sample collection activities prescribed in the Sampling and Analysis Plan (SAP) for the Project. **Section 4** includes a summary of the relevant exposure criteria and pathways used to evaluate the analytical findings from the investigation. **Section 5** through **Section 15** provide detailed findings including figures and tables summarizing analytical results for the QMCP. **Section 16** includes a summary of conclusions and recommendations. **Section 17** includes references utilized in the development of this SI Report.

## 1.1 PROBLEM DEFINITION

The Project was characterized by the risks posed by chemical containers and residues historically discarded in or near Torch Lake and along the north shoreline of the Portage Canal. These concerns are distinct and separate from the risks historically addressed under the U.S. Environmental Protection Agency's (EPA's) Superfund program. The RRD Superfund Section (SFS) has stated that the EPA defines the Torch Lake Superfund Site as the upper six inches (in.) of stamp sand and slag in certain areas of Houghton County and any soil cap and vegetative cover applied to such areas.

The remaining concerns at Torch Lake, the Portage Canal, and the surrounding areas identified by EGLE included known or suspected impacts to groundwater, surface water, sediments, and upland media that were not addressed under the Superfund program. Environmental impacts that were evaluated as part of the SI were assessed under the guidance of the following objectives:

- Investigate and document unidentified, significant in-lake and/or terrestrial sources of contamination including polychlorinated biphenyls (PCBs);
- Investigate and document bulk disposal areas, including made lands, stamp sand deposits, slag dumps, and landfills; and,
- Investigate and document industrial ruins including coal storage areas, underground storage tanks (USTs), asbestos containing materials (ACM), residual process materials (RPM), and any other waste materials identified during investigations.

Environmental impairments within Torch Lake and along the shorelines from Lake Linden to the Portage Lake Lift Bridge resulting from historical mining era industrial operations:

- Present potential exposure risk to human and ecological receptors;
- Limit the recovery of the Torch Lake and Portage Canal ecosystems;
- Create uncertainty over safe and beneficial reuse of the land; and,
- Delay delisting of Torch Lake as an Area of Concern (AOC) under the Great Lakes Water Quality Agreement due to Beneficial Use Impairments (BUIs) related to restrictions on fish and wildlife consumption because of the on-going presence of PCBs and mercury in fish and degradation of benthos because of metals contaminated sediments.

As such, the investigation was largely driven by documented observations of abandoned containers and/or other waste and debris locations in the lake and in upland areas, supported by documented historic operations.

Taking into account the specific objectives outlined above, the principal goal of this portion of the Project was to support a comprehensive management approach that would guide EGLE's decision making process in addressing potential human health and environmental risks present in the QMCP. The primary focus of the Project was to ascertain the source, nature, and extent of contaminants (including PCBs) in all affected environmental media (soil, groundwater, surface water, and sediments) within the Project study area, including the QMCP that consists of the former mining era industrial areas from the Portage Lake Lift Bridge in Hancock to Dollar Bay along the north shoreline of the Portage Canal. Refer to **Figure 1-1, Project Location Map**. Due to the varying nature of historical operations within the QMCP, subareas addressed as part of this SI work were as follows:

- Area A;
- Area B;
- Area E;
- Area F;
- Area H;
- Area J;
- Area K
- Area M;
- Area O; and,
- Area P.

The locations of the listed subareas are depicted on **Figure 1-2, Area Features Map** on the following page and in the Figures Section of this report.

## 1.2 PROJECT ORGANIZATION

Performance of the work required that both the Project team and the Project structure were focused and deliberate. The phased approach of the work required that data was processed and reported between team members to facilitate the next phase of work. The following subsections describe the Project team and the Project structure, as it relates to management and implementation.

### Project Team

The Project was developed and implemented by EGLE, building on the existing partnerships and stakeholder engagement in the local community. Field activities were completed by EGLE's Geological Services Section (GSS) (formerly the Geological Services Unit) and MSG. Analytical services were provided by EGLE's Environmental Laboratory or approved laboratories within the Contract Laboratory program.

### Project Structure

The Project area is located in Houghton County, Michigan along the shoreline and in Torch Lake and the Portage Canal, and mining era industrial facilities in Dollar Bay and on the Ripley Waterfront along the Portage Canal, the 270+ acre Centennial Mine, and other areas congruent with the Torch Lake Superfund Site where the response action has been limited to the application of vegetative cover or eliminating the area from further consideration.

Due to the complex nature and geographic expanse, RRD subdivided the Project into study areas based on past use and known issues. Dividing the regional operations into smaller manageable study areas allowed for prioritization of the proposed investigative approach, while also establishing a phased process for assessing environmental concerns regionally.

The QMCP, Quincy Mining Company Mason Operations Area (QMCM), Calumet and Hecla Lake Linden Operations Area (CHLL), and Calumet and Hecla Tamarack City Operations Area (CHTC) areas and their respective former industrial operations are depicted on **Figure 1-1, Project Location Map**. The aforementioned subareas that comprise the QMCP and major historical industrial operations within each subarea addressed in this SI Report are depicted on **Figure 1-2, Area Features Map** and described further in **Section 2**.

## 2. PROJECT DESCRIPTION

Hard rock mining operations were prevalent throughout Houghton and Keweenaw Counties for nearly a century, primarily spanning an era between the mid-1800s and the mid-1900s. As mining activities declined in the region, a majority of the mine holdings, including surface and underground operations were abandoned, scrapped, and remnants otherwise left in-place. The following subsections summarize both the operational and investigative history within the QMCP while also presenting the underlying rationale for the performance of the investigative activities.

### 2.1 SITE LOCATION AND DESCRIPTION

As previously discussed, the QMCP encompasses the former QMC copper mining and processing operations along the north shoreline of the Portage Canal on the south side of M-26 from Dollar Bay, Michigan to the Portage Lake Lift Bridge in Hancock, Michigan. The QMCP consists of approximately 320 acres of land, much of which is made-lands, extending approximately 4.5 miles along the shoreline of the Portage Canal and incorporates multiple parcels and property owners. Residential (single-family residences)/commercial/vacant, undeveloped forested lands, industrial (capped made lands) properties, and the Portage Canal border the QMCP. Due to the varying nature of historical operations within QMCP, the SI was organized by subareas within the footprint that have been subject to or associated with historic mining practices.

#### 2.1.1 Portage Canal

The subareas described in **Section 1** are located along the shoreline of the Portage Canal. Each of these former industrial operations relied on the waters of the Portage Canal for shipping, process water, and waste discharge. In addition, the communities established around these industrial facilities also used the lake for similar purposes, historically discharging sewage and other wastes into the lake.

A goal of the SI was to assess the potential presence of abandoned containers and wastes on the bottom of the Portage Canal in the QMCP and to more fully characterize the nature and extent of potential on-land contaminant sources. The evaluation of potential PCB sources and areas of PCB contamination in and around the Portage Canal were an integral component of the SI that support the long-term protection and rehabilitation of the interconnected waterways.

### 2.2 SITE BACKGROUND

This Section provides an overview of the historical industrial operations, the local topography, geology, and hydrogeology, and past investigations and response actions in the QMCP.

#### 2.2.1 Site History

Copper mining was extensive in the Keweenaw and formed the backbone of the regional economy and society. Copper ore milling and smelting operations were conducted from the mid-1860s to the 1960s, including the importation, reprocessing, and smelting of various scrap metals in the later years of operation. Consistent with past industrial practices, Torch Lake and the Portage Canal served as dumping grounds for virtually all mining industry related wastes, including tailings, slag, and various chemicals.

Based on a review of Sanborn Fire Insurance maps, prior QMCP land uses consisted of a combination of industrial operations including, but not limited to, foundry, machining, coal and coke handling, bulk fuel handling, and boiler works. Simultaneously with industrial development, made lands were created as indicated by the approximate 1865 shoreline depicted on **Figure 1-2, Area Features Map**. This is of importance as to the nature of the underlying fill material relative to the current areas of environmental interest.

Review of EGLE file information for QMCP identified subareas within the footprint that have been subject to or associated with historic mining practices. Parcels within the QMCP footprint that did not have identified mining-era uses were not further evaluated or included in subsequent reconnaissance activities. Due to the varying nature of historical land uses within QMCP, the following list provides an overview of known historic operations based on available Sanborn Maps and/or other resources for each of the subareas identified on **Figure 1-2, Area Features Map**.

- **Area A** – Historically, the western portion of Area A was the location of the Copper Range Railroad Passenger Depot. According to the 1907 Sanborn Map, a “vacant” Lake Superior Smelting Company was located to the east. The parcel is identified as the H.S. Goodell Distributing Station for Lubricating Oils in 1917 and the H.S. Goodell and Company Bulk Oil Station in 1949. The area is currently the location of a condominium complex and the Houghton County Marina.
- **Area B** – Review of the 1907 Sanborn Map indicates Lake Superior Iron Works operated in the southern portion of Area B. The site is identified as the Portage Lake Foundry and Machinery Company on the 1928 Sanborn Map and by 1949 was the location of the Houghton County Road Commission. The northern portion of Area B was identified as a Store House with additional dwellings in 1928 and the location of a filling station in 1949. Area B is currently the location of the Houghton County Road Commission.
- **Area E** – Historic land use and/or operations are unknown following review of available historic Sanborn Maps and other resources. The area is currently undeveloped and appears to be used for boat storage. In July 2018, a Michigan Department of Natural Resources (MDNR) surveyor observed potentially impacted soils within the MDNR trail property within Area E.
- **Area F** – A manufactured gas plant was in operation at the location of Area F, south of the MDNR trail property. Environmental concerns within this area have previously been addressed and further investigation as part of QMCP did not occur. A Filling Station and Bulk Oil Station that included various gasoline, kerosene, and fuel oil tanks, along with oil and oil pump houses operated within the northwestern portion of Area F, as identified on the 1949 Sanborn Map. Environmental concerns in this area will be addressed separate from QMCP. A commercial business currently operates at the location north of the MDNR trail property, while a residential building and vacant lot are located to the south and east, respectively.
- **Area H** – Historic land use and/or operations are unknown following review of available historic Sanborn Maps and other resources. Recent uses of the area include multiple commercial businesses including Dollar Bay Motor Sports, Isle Royale Seaplanes, and Wuebben Construction.
- **Area J** – Area J was the location of the Houghton Lumber Yard Company and the Dollar Bay Lumber Company, according to the 1917 and 1928 Sanborn Maps, respectively. However, according to the 1949 Sanborn Map, Henry Borth Company - Manufacturing R.R. Shims and UP Oil Company operated within the area. H&Y Marina currently operates at the location.
- **Area K** – According to the 1907 Sanborn Map, Tamarack and Osceola Mining Company had mining operations at the location. By 1917, the location was the site of a Calumet and Hecla Mining Company Coal Dock. The area is currently the location of a condominium complex.
- **Area M** – Lake Superior Smelting Company operated at the location, as identified on the 1928 Sanborn Map; however, only two ice houses remained at the site on the 1949 Sanborn Map. The EPA as part of the Torch Lake Superfund Site remedial action capped portions of Area M, N (not discussed in this report), and O. Dollar Bay Torch Lake EPA Superfund Site as-built drawings (USDA NRCS, 2004) indicate that the cap was placed as part of the Torch Lake Superfund Site Dollar Bay remedial action. The Fourth Five-Year Review Report for the Torch Lake Superfund Site (USEPA, 2018) indicated that construction was completed in 2002; however, the Dollar Bay parcel has not been deleted from the NPL. The capped areas are subject to an on-going EGLE operation and maintenance (O&M) plan. The balance of the areas were not addressed as part of the Torch Lake Superfund Site remedial action. A building that houses two production wells for water supply to Dollar Bay is currently located within the area. The area appears to be undeveloped with the exception of the Dollar Bay municipal wells.
- **Area O** – According to the 1907 Sanborn Map, Area O was the location of Dollar Bay Land and Improvement Company. The parcel is identified as Dollar Bay Lumber Company in 1917 and Dollar Bay Lumber Company

Saw Mill and Lumber Yard and Horner Flooring Company Wood Flooring Mill in 1949. Horner Flooring Co. Inc., a manufacturer of hardwood maple basketball flooring, currently operates at the location. The EPA as part of the Torch Lake Superfund Site remedial action capped portions of Areas M, N, and O. Dollar Bay Torch Lake EPA Superfund Site as-built drawings (USDA NRCS, 2004) indicate that the cap was placed as part of the Torch Lake Superfund Site Dollar Bay remedial action. The Fourth Five-Year Review Report for the Torch Lake Superfund Site (USEPA, 2018) indicated that construction was completed in 2002; however, the Dollar Bay parcel has not been deleted from the NPL. The capped areas are subject to an on-going EGLE O&M plan. The balance of the areas were not addressed as part of the Torch Lake Superfund Site remedial action.

- **Area P** – This area was not identified on available Sanborn Maps; however, further review of Monette's *Dollar Bay, Michigan, Fifty-Fourth of a Local History Series* (Monette, 2000), indicates that the parcel was owned by Lake Superior Smelting Company and was used as a slag dump. Recent use appeared to be a scrap/recycling facility called "The People's Store," and includes a residential and farm area to the east.

A summary of historical findings is presented in **Table 2-1, Summary of Historic Operations**.

Dollar Bay Torch Lake EPA Superfund Site as-built drawings (USDA NRCS 2004) indicate that the vegetated cap at Area M and Area O in the Dollar Bay portion of QMCP was placed as part of the Torch Lake Superfund Site Dollar Bay remedial action. Quincy Smelter Reclamation Project as-built drawings (USDA NRCS 2010) indicate that a vegetated cap was also placed at Quincy Smelting Works to the east of Area B. The capped areas are subject to an on-going EGLE O&M plan. The approximate limits of capping are depicted on **Figure 1-2, Area Features Map**.

### 2.2.2 Topography and Local Geology

The QMCP is located along the north shoreline of the Portage Canal on the south side of M-26 from Dollar Bay, Michigan to the Portage Lake Lift Bridge in Hancock, Houghton County, Michigan. The shoreline in this area was historically characterized by industrial operations that included large-scale copper mining-related operations. Simultaneously with industrial development, made lands were created along the shoreline as indicated by the 1865 shoreline depicted in **Figure 1-2, Area Features Map**. Waste materials, such as stamp sand from industrial operations, were also deposited along the shoreline, dramatically changing the natural shoreline of the Portage Canal and the lake bottom.

At a mean elevation of approximately 600 feet (ft) Above Mean Sea Level (AMSL) at the shoreline of the Portage Canal, the land slopes gently to the north from the shoreline to an approximate elevation of 630 ft AMSL along Highway M-26. The vicinity of Highway M-26 is generally characterized by residential and commercial developments that are generally built up along the toe of the hillside on the north side of M-26. North of Highway M-26, and the centrally developed area along the highway, the grade continues to increase towards the north, away from the Portage Canal, reaching elevations up to 1,200 ft AMSL along Highway U.S. 41. Numerous residential properties are scattered across the hillside along rural roads that connect the upper and lower highways, but also in small clusters of homes that generally developed as employee housing around historic mining locations. The unincorporated community of Ripley is located to the north of the QMCP, where elevations reach 700 ft AMSL at the north end of the residential area. The village of Dollar Bay is located to the east, where elevations remain around 620 ft AMSL.

The QMCP is located within the Lake Superior Basin and the Keweenaw Peninsula Watershed. There are small, unnamed creeks, streams and storm water outlets that discharge to the Portage Canal in the vicinity. The largest is Gooseneck Creek which discharges to the designated wetland area located northeast of Dollar Bay.

According to the *Soil Survey of Houghton County Area, Michigan* issued in October 1991 by the United States Department of Agriculture (USDA) – Soil Conservation Service (SCS), the near surface geology in the QMCP generally consists of soils that have been covered with fill in areas south of Highway M-26.

- For soils in the QMCP, the USDA generally describes the soils as being in “...areas that have been covered with fill. In some areas the upper one to two feet of the original soil material has been removed for use as topsoil. The texture ranges from sand to clay loam. In most areas the soils are somewhat excessively drained to moderately well drained, but in some areas they are somewhat poorly drained or poorly drained. Many of these areas are old copper mill sites and contain numerous foundations and abandoned railroad grades.”

According to the map Quaternary Geology of Michigan (compiled in 1982 by W.R. Farrand and published by the Michigan Geological Survey), the near surface fill material and sands are underlain by native soils described as “coarse-textured glacial till.” The bedrock in the area of the QMCP consists of Portage Lake Lava Series to the west and Jacobsville Sandstone to the east according to the *Bedrock Geology of Michigan* (R.L. Milstein, 1987).

Soil observations during the SI activities indicate that the subsurface within the QMCP area is generally comprised of fine to medium or medium to coarse brown sand to the end of boring, which was typically between 7 and 12 feet below ground surface (ft bgs). At least some of the encountered media, though recorded as sand, was likely stamp sand.

### **2.2.3 Local Hydrogeology**

According to EGLE’s Well Water Viewer, drinking water in the area is obtained entirely from groundwater sources. The community of Ripley is served by two municipal wells located at the end of Burt Street, north of Highway M-26. Two municipal wells that are both 100 feet deep were located at the former Quincy Smelting Works in Ripley. The community of Dollar Bay is served by two municipal wells located at the end of Horner Street in Dollar Bay. The municipal wells are 44 and 64 feet deep and were constructed in 1958 and 1979, respectively. Three additional municipal wells located approximately 1 mile southwest of the QMCP study area on the south shore of the Portage Canal provide drinking water to approximately 7,500 residents of the City of Houghton. Residential wells are used to provide water to the remainder of the population within the four-mile radius of the QMCP, while the Michigan American Water Company operates public water supply wells outside of the four-mile search radius. Please note that the search results are not a detailed representation of every potential groundwater receptor, nor did the search include a comprehensive assessment of water service in the QMCP.

Based on geological composition, it has been noted that the shallow glacial aquifers and bedrock aquifers in the region are likely interconnected. As noted in the preceding subsection, several small streams drain to the Portage Canal near the QMCP. The Portage Canal and the Keweenaw Waterway connect to Lake Superior.

During the SI activities, saturated soil conditions were generally encountered between depths of 3 ft and 9 ft bgs.

### **2.2.4 Overview of Regulatory Investigations and Response Actions**

The Project area, including the lands and waterways throughout the Keweenaw Peninsula, were the location of copper milling and beneficiation activities beginning in circa 1868. The environmental legacy resulting from over 100 years of mining led to Torch Lake and its western shoreline, and surrounding water bodies and former mining era industrial properties throughout Houghton County to be designated as a Superfund site by the EPA [Torch Lake Superfund Site](#) and Torch Lake as a Great Lakes Area of Concern by the U.S. government (in consultation with the States) under the Great Lakes Water Quality Agreement [Torch Lake AOC](#). The EPA undertook cleanup activities to address some of the byproducts of the mining industry while others were not addressed or left to recover through natural processes. Through a series of studies EPA concluded the Torch Lake Site posed actual or threatened releases of hazardous substances that may present an imminent and substantial endangerment to public health, welfare, or the environment. Given the complexity of the region wide issue, the EPA’s 1992 Record of Decision (ROD) divided the Torch Lake Site into three Operable Units (OUs):

- **OU 1** includes surface tailings, drums, and slag pile/beach on the western shore of Torch Lake. These tailing piles include stamp sands in Lake Linden, Hubbell/Tamarack City, and Mason, while a slag pile/beach is located in Hubbell;
- **OU 2** includes groundwater, surface water, submerged tailings and sediments in Torch Lake, Portage Lake, the Portage Canal, and other water bodies; and,
- **OU 3** includes tailings and slag deposits located in the north entry of Lake Superior, Michigan Smelter, Quincy Smelter, Calumet Lake, Isle-Royale, Boston Pond, and Grosse-Point.

The OU 1 and OU 3 remedy selected and implemented by the EPA required that stamp sands, tailings, and slag piles be covered with soil and vegetation, and that use restrictions be put in place to protect the covered materials' long-term integrity. Through these measures it was concluded that the following Remedial Action Objectives (RAO) would be met:

- Reduce or minimize potential future risks to human health associated with the inhalation of airborne contaminants from the tailings and/or slag;
- Reduce or minimize potential future risks to human health associated with direct contact with and/or the ingestion of the tailings and/or the slag;
- Reduce or minimize the release of contaminants in tailings to the groundwater through leaching; and,
- Reduce or minimize the release of contaminants in tailings to the surface water and sediment by soil erosion and/or air deposition.

The EPA selected a "No Action" remedy in their 1994 ROD for OU 2. To meet the RAO, the remedy selected for OU 2 took into consideration and relied upon:

- The reduction of stamp sand loading to surface water bodies expected as a result of the remedial action taken at OU 1 and OU 3;
- Ongoing natural sedimentation and detoxification such as that which is occurring in other surface water bodies in the area;
- Institutional programs and practices controlling potential future exposure to site-affected groundwater which are administered at the county and state level; and,
- The long-term monitoring and the five-year review process monitoring requirements of the remedy selected for OU 1 and OU 3 under the 1992 ROD.

The QMCP study area is located within the Torch Lake Superfund Site footprint; however, the properties south of M-26 identified for assessment were not included in the Torch Lake Superfund Site OU1, nor were remedies put in place to mitigate environmental conditions on the properties except as described in **Section 2.2.1** above for certain Dollar Bay locations and at the Quincy Smelting Works which was not further investigated during this SI since environmental concerns at that property are being addressed by other entities. OU 2, for which EPA selected a no-action alternative, includes groundwater, surface water, submerged tailings (stamp sands), and sediment that were also investigated.

Numerous environmental investigations and response activities have been completed within the QMCP by state and federal agencies as well as private parties. The investigations were conducted on and along the north shoreline of the Portage Canal with various purposes, often specific to a particular property or investigative focus. Although often referenced in individual reports, a comprehensive approach consolidating the findings of these investigations had not been completed to date.

The data and information derived from these investigations were assimilated and compiled by EGLE and summarized by MSG in a document entitled *Historical Data Review and Compilation Technical Memorandum Abandoned Mining Wastes – Torch Lake Non-Superfund Site – Quincy Mining Company Portage Operations Area* dated August 2018 and discussed further in **Section 3**. The findings of these investigations and the conclusions derived from the performance of each assessment were selected to assist in the identification of historic areas of contamination or data gaps requiring further assessment.

Response actions completed in the QMCP include the aforementioned capping activities completed by the EPA. “The stabilization and covering of contaminated mine tailings and slag material in areas of Torch Lake or surrounding water bodies also reportedly included the recording of institutional controls, the natural recovery of area water bodies, and long-term monitoring of area water bodies and groundwater (EPA, 2008).” The capped area of the Quincy Smelting Works within the QMCP was delisted from the (National Priorities List) Torch Lake Superfund Site in 2013, while the capped portion of The Torch Lake Superfund Site Dollar Bay has not been deleted from the NPL. EGLE has taken responsibility for operation and maintenance activities in those areas where remedial actions have been implemented, regardless of listing.

Investigations in the QMCP have identified elevated levels of volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), being predominantly polynuclear aromatics (PNAs), PCBs, and inorganic contaminants. Areas with concerns along the shoreline of the Portage Canal, identified by EGLE and others, include known or suspected impacts to groundwater, surface water, sediments, and upland media that were not addressed under the Superfund program.

### 3. FIELD PROCEDURES AND SAMPLE COLLECTION

The field procedures and sample collection activities that were implemented in the QMCP were used to evaluate the presence of contaminated environmental media in the industrial areas described in **Section 2**. This Section describes the phased approach for reviewing and assessing each area and the subsequent field sampling and laboratory analysis that followed.

#### 3.1 PLANNING AND COORDINATION

The assessment and investigation of the QMCP included several steps that served as the foundation for the *Sampling and Analysis Plan for the Abandoned Mining Wastes Torch Lake Non-Superfund Site, Quincy Mining Company Portage Operations Area, Houghton County, Michigan* (SAP) prepared by MSG in August 2018 and periodically amended based on interim SI findings. The following subsections describe the research, mapping, and testing procedures that were utilized during SAP development to ensure that the investigative activities were not redundant and focused on the goals and objectives established by EGLE.

##### 3.1.1 Historical Research and Data Compilation

The implementation of the investigative portion of the SI was closely linked to the collaborative efforts of the Project team, described in **Section 1**. The review of EGLE file information, including available Sanborn Maps and/or other resources for each area was critical to the development of the SAP since the findings specifically identified the location of facilities and operational areas that were historically subject to or associated with historic mining practices. The following provides a summary of the activities completed by EGLE and summarized by MSG that were used to support SAP development:

- Identification of potential sources of contaminants of concern (COCs), including PCBs, through the evaluation of previously collected data.
- Investigation of resources related to buildings and/or operations of environmental concerns by subarea.
- Completion of mapping activities based on collected historic data, and field inspections noting the location of foundations and building remnants.

A summary of historical findings is presented in **Table 2-1**, *Summary of Historic Operations*.

##### 3.1.2 Data Compilation Technical Memorandum

As outlined in **Section 2**, the comprehensive nature of the SI entailed not only a historical operational perspective, but also required that the results of previous investigative activities be incorporated. The evaluation and interpretation of analytical results and findings from previous key investigations was completed to create a baseline understanding of conditions in the QMCP and along the Portage Canal. The incorporation of these findings into the sampling program not only minimized redundancies in data collection, but also created a more comprehensive approach for assessing potential environmental impacts.

The following is a list of the key documents summarized in the *Historical Data Review and Compilation Technical Memorandum Abandoned Mining Wastes – Torch Lake Non-Superfund Site – Quincy Mining Company Portage Operations Area* dated August 2018:

- Michigan Department of Transportation M-DOT M-26, Ripley, Houghton County Hydrogeological Investigation – April 18, 1991. Prepared by M-DOT Geoenvironmental Services Unit Materials & Technology Division.
- 1<sup>st</sup> Preliminary Report Dollar Bay Wells – March 31, 1995. Prepared by Traverse Engineering Services.

- Letter of Notice Re: Complaint Inspection, Julio Construction Property Adjacent to Keweenaw Canal, Ripley, Houghton County – December 12, 1995. Prepared by Michigan Department of Environmental Quality (MDEQ, now EGLE).
- Phase II Hydrogeological Investigation Report, Houghton County Road Commission Ripley Garage – August 1998. Prepared for Houghton County Road Commission. Prepared by SCA Environmental.
- Brownfield Redevelopment Assessment Report for Hancock/Ripley Trail Property – November 25, 2002. Prepared by MDEQ.
- Summary Report for the Torch Lake Area Assessment, Torch Lake NPL Site and Surrounding Area, Keweenaw Peninsula, Michigan – December 13, 2007. Prepared by Weston Solutions, Inc.
- Letter of Notice Re: Dollar Bay Well Field, Dollar Bay, Houghton County, Site ID: 31000089 – August 4, 2010. Prepared by the Michigan Department of Natural Resources and Environment (DNRE, now EGLE).
- Baseline Environmental Assessment: Royce Road Marina, Royce Road, Franklin Township, Houghton County, MI 49930 – October 26, 2015. Prepared by TriMedia Environmental & Engineering (TriMedia).
- Correspondence between Horner Flooring Co. Inc. and MDEQ – April 3, 1995.
- Quincy Mining Company Portage, Houghton County, Site ID #31000098, Bathymetric Investigation-Side Scan Sonar– January 9, 2018. Prepared by MDEQ.

In support of developing a comprehensive approach for evaluating risks, the analytical results from the investigations summarized above were compiled and compared to the same regulatory criteria. Consistent with this approach, the same regulatory criteria were used to evaluate the analytical results collected during the SI. The regulatory criteria utilized for evaluating analytical results from surface soil, subsurface soil, groundwater, sediment, surface water, building materials, and waste deposits are discussed in detail in **Section 4**.

The analytical results from these key investigations were used to characterize the QMCP and contributed to the horizontal and vertical placement of the proposed sampling locations presented in the SAP. Consequently, the review and evaluation of the summarized reports resulted in the preparation of a SAP that built upon existing analytical results and focused on potential risks posed to human health and ecological receptors. In addition, the SI was also guided by the documented observations of drum and/or other debris locations as well as considerations related to historic operations and potential PCB presence.

### **3.1.3 Offshore Mapping and Procedural Testing**

Without available analytical results from surface water and sediment samples, it could not be determined whether contaminants emanating from documented contamination on land were impacting the nearshore aquatic environment of the Portage Canal. The visual confirmation of the underwater targets was a key component to the Project, distinguishing it from previous investigations by eliminating the concept of “blind” sampling and focusing sample locations on specific waste deposits.

Evaluation of these underwater features as part of the SI required the use of advanced technological methods to identify specific targets for sample collection. Completion of these tasks again relied upon the collaborative efforts of the Project team to conduct underwater mapping and video surveillance of the lake bottom.

In 2017, EGLE's GSS conducted a side scan sonar survey of the three investigative lake bottom areas located in the Portage Canal offshore from the communities of Ripley and Dollar Bay. Areas were scanned using a Hummingbird 797c<sup>2</sup> equipped with an external global positioning (GPS) antenna, results were interpreted, and areas where targets were most likely to be present were identified. The intent of the assessment was to collect qualitative data that could be used to develop a plan for more traditional investigation, sampling, and assessment of potential offshore contaminant sources. The side scan sonar images generated by EGLE's GSS are included in **Appendix A, Side Scan Sonar Imagery**.

The next step of the investigation included visual confirmation of the targets that were identified through the interpretation of the side-scan sonar imagery. EGLE's GSS deployed their Remotely Operated Vehicle (ROV) at select locations to investigate and provide visual evidence of potential drum locations and similar anomalous underwater features. Underwater images and videos obtained from the ROV are included in **Appendix B, Underwater Videos**.

### 3.1.4 Sampling and Analysis Plan Development

The development of the SAP for the QMCP was focused on ensuring that it considered relevant historic operational and investigative findings. Identification of buildings and facility operations provided an understanding of potential chemicals and waste streams that may have been used or disposed of on a given property. For example, PCBs are often regarded as an oil or fluid used in electrical generating facilities, but PCBs were also used for their fire retardant properties in electrical cables.

With an understanding of the historical operations, the findings of previous terrestrial analytical data were evaluated. Data was assessed with regard to the historical operations, but also to evaluate whether concentrations of specific COCs were present. If identified, the horizontal and vertical distribution was then evaluated. The evaluation considered whether additional data was needed to further delineate the extent of contamination or evaluate whether a potential source of contamination was contributing to the detection of contaminants. Similarly, the lack of analytical data in the study area, such as any available offshore analytical data, was also considered to determine if data gaps were present.

The risks posed to human health and the environment resulting from historical mining era industrial operations in the QMCP:

- Present potential exposure risk to human and ecological receptors;
- Limit the recovery of the Portage Canal ecosystem; and,
- Create uncertainty over safe and beneficial reuse of the land.

As such, the investigation was largely driven by documented historic operations and potential PCB concentrations in terrestrial portions of the QMCP. The prevailing COCs in the QMCP generally include organic and inorganic contaminants in surface and subsurface soils, groundwater, sediment, surface water, waste, and RPM. In addition, observed waste deposits and building materials were suspected to contain asbestos in addition to organic and inorganic contaminants. As a result, the SAP identified key analytes in environmental media for assessment during the SI. Although PCBs were prescribed for analysis in all environmental media, the selection of remaining analytes were subject to field observations and the judgment of the field teams collecting the samples. The following provides a summary of the target analytes defined in the SAP with respect to the investigated environmental media:

#### Surface Soils/Waste Deposits (0 to 6 inches below ground surface [bgs])

- Inorganic COCs (Metals and Available Cyanide) by EPA Methods 6010/200.7, 6020/200.8, 7471/245.5, and ASTM D7284;
- VOCs by EPA Method 8260;
- PCBs by EPA Methods 8081/8082;
- SVOCs by EPA Method 8270; and,

- Asbestos by Polarizing Light Microscopy (PLM) – California Air Resource Board (CARB) 435 – 1,000 point count – analytical sensitivity 0.1 percent (%).

#### Subsurface Soils (> 6 inches bgs)

- Inorganic COCs (Metals and Available Cyanide) by EPA Methods 6010/200.7, 6020/200.8, 7471/245.5, and ASTM D7284;
- VOCs by EPA Method 8260;
- PCBs by EPA Methods 8081/8082; and,
- SVOCs by EPA Method 8270.

#### Groundwater

- Inorganic COCs (Metals) by EPA Methods 6010/200.7, 6020/200.8, and 7471/245.5;
- VOCs by EPA Method 8260;
- PCBs by EPA Methods 8081/8082; and,
- SVOCs by EPA Method 8270.

#### Sediment

- Inorganic COCs (Metals) by EPA Methods 6010/200.7, 6020/200.8, and 7471/245; and,
- PCBs by EPA Methods 8081/8082.

#### Surface Water

- Inorganic COCs (Metals) by EPA Methods 6010/200.7, 6020/200.8, 7471/245.5;
- PCBs by EPA Methods 8081/8082; and,
- SVOCs by EPA Method 8270.

#### Drums, Containers, Building Materials, Bulk Asbestos, Waste Deposits and Residual Process Materials – Not Associated with Sediment/Depositional Wastes

- Inorganic COCs (Metals) by EPA Methods 6010/200.7, 6020/200.8, 7471/245.5;
- PCBs by EPA Methods 8081/8082;
- Bulk Asbestos by PLM Method 600/R-93/116; and,
- Waste Characteristics by various methods.

Inorganic COCs were selected for analysis based on an assessment of historical exceedances of applicable regulatory criteria. Eleven inorganic COCs and cyanide were initially selected for analyses. The following provides a list of the selected inorganic analytes evaluated during the SI:

- Arsenic
- Barium
- Cadmium
- Chromium
- Copper
- Cyanide
- Lead
- Manganese
- Mercury
- Selenium

- Silver
- Zinc

The species of chromium, trivalent versus hexavalent, was assessed and determined for environmental media during previous investigations in the area. The *Public Health Assessment for Evaluation of Inhalation of Airborne Stamp Sands in the Torch Lake Superfund Site and Surrounding Area* (Michigan Department of Community Health (MDCH), 2014) noted that “one would not expect the hexavalent chromium form to occur in stamp sands because the trivalent chromium is typically the predominant form of chromium in the environment.” Therefore, samples analyzed during the SI were not further assessed for hexavalent chromium and regulatory criteria for trivalent chromium were utilized in the subsequent evaluation of data (both historical and current) derived from the QMCP.

## 3.2 FIELD PROCEDURES AND SAMPLE COLLECTION

Similar to SAP development, the implementation of field activities in the QMCP were conducted in several terrestrial and offshore phases to ensure that sufficient data was available to adequately characterize the potential human health and environmental risks present in each study area. Field sampling activities were generally completed during mobilizations in September 2018.

The following subsections summarize the procedures and methodologies used during the SI.

### 3.2.1 Potential Physical and Health Hazard Inventory

The evaluation of the QMCP included a physical inspection of the properties within the study area. Field inspections were conducted on properties where written access was granted to EGLE. In the cases where access was not requested based on historic operational and investigative findings, or access was not obtained, property conditions were evaluated from MDNR property, a neighboring property where access was obtained, or public right of way. The inspections included the locating and inventory of historical structures and artifacts associated with the former mining era operations within the QMCP. Each property or subarea was also inspected for potential physical and health hazards. Such hazards included potentially abandoned drums and containers, suspect asbestos containing materials (SACM), stained or oily soils, and similar observed environmental conditions. Potential physical hazards, including waste deposits, metal debris, and similar conditions were also recorded in areas accessed.

The effort included the development of field inspection tables that incorporated photographic documentation and written descriptions of identified features. Reconnaissance activities were completed at all of the properties in the QMCP. A Reconnaissance Log was used to document the general characteristics of the property including the inventory and documentation of mining era features, if any, for each property. The form was also used to document potential physical and health hazards identified on the property that warranted further inspection or sampling to adequately characterize potential risks. Completed Reconnaissance Logs are included in **Appendix C, Site Inspections – Reconnaissance Logs, Targeted Inspections & Physical Hazards Inventory**.

The findings of the reconnaissance activities were used to facilitate the next phase of inspection. Targeted inspections included revisiting documented hazards and collecting samples to better characterize the perceived risks documented during reconnaissance. It should be noted that targeted inspection activities did not occur in all subareas due to site inspection reconnaissance evaluation. The following provides a summary of the various media that either were sampled or were considered for sampling during the targeted inspection activities:

- Documented SACM was sampled by a State of Michigan licensed asbestos inspector. The sampled media was asphaltic roofing material.

- Documented abandoned containers were not opened and sampled due to health and safety considerations; however, exposed contents or surface soils adjacent to the containers were considered for sampling.
- Documented abandoned container contents and RPM were considered for sampling.
- Soil and groundwater were sampled to characterize Site conditions based on historic use and observation of potentially contaminated areas.

### 3.2.2 Bulk Material Sampling

An MSG State of Michigan licensed asbestos inspector collected one bulk SACM sample during the Fall 2018 sampling event. The sample location was based on documented SACM and included asphaltic roofing material observed in Area M. In accordance with the SAP, MSG utilized dedicated sampling equipment for each sample to prevent potential cross contamination of asbestos fibers and samples were placed in sealable plastic bags/containers. Each sample bag was labeled with the unique sample identifier, date, and time of sampling following sample collection. Sampling data—including sample analyses, sample collection times and dates—were recorded on laboratory chain-of-custody forms. The samples were submitted under chain-of-custody to TestAmerica, Inc. North Canton, Ohio for analysis of asbestos content by PLM analyses.

The sampled location was located with a GPS unit with sub-meter accuracy and photographed. A summary of the targeted inspection sampling, including descriptions, requested analyses, and other relevant information is included on **Table 3-1, Sampling and Analysis Summary**. Findings are provided in **Section 12**.

### 3.2.3 Surface Soil Sampling

Proposed surface soil sampling locations were predetermined in the SAP based on the evaluations and assessments presented in **Section 3.1**.

Surface soil samples were collected from proposed surface soil (0-6 in.) sampling locations throughout the QMCP. A total of 15 surface soil samples (SS designation), including quality assurance (QA)/quality control (QC) samples, were collected from the QMCP. Disposable (dedicated) scoops were used to collect soil from a depth of 0 to 6 inches below the ground surface. Samples were placed in laboratory-supplied, 8-ounce glass jars in accordance with the SAP. Sample labels containing the unique sample identifier, date and time of sampling were attached to each 8-oz jar prior to sample collection. Sampling data—including sample analyses, sample collection times and dates—were recorded on laboratory chain-of-custody forms. The samples were submitted under chain-of-custody to EGLE's Environmental Laboratory in Lansing, Michigan for analysis as outlined in the SAP. Each of the sample locations were located with a GPS unit with sub-meter accuracy and a description of the sampled material was documented on a field log. A photographic log documenting representative sample collection activities is included in **Appendix D, Photographic Log**. A summary of the samples collected, including their descriptions, requested analyses, and other relevant information is included in **Table 3-1, Sampling and Analysis Summary**. Sampling locations, analytical results, and findings are included in **Section 5** through **Section 14** of this SI Report.

### 3.2.4 Subsurface Soil Sampling

Proposed subsurface soil sampling locations were predetermined in the SAP based on the evaluations and assessments presented in **Section 3.1**.

Prior to subsurface investigative activities, proposed investigative locations were cleared of potential underground utility lines or other anomalies prior to mobilization. MSG staked the investigative locations, Michigan's one-call system was notified of the scheduled work in accordance with *Public Act 174, Miss Dig Underground Facility Damage Prevention*

and Safety Act, a joint utility meeting was conducted, and utility lines within were marked by the respective utility companies. Additionally, GSS performed ground penetrating radar (GPR) activities at proposed boring locations to identify any additional underground anomalies prior to the commencement of fieldwork.

Subsurface soil samples were collected from throughout the QMCP. A total of 24 subsurface soil samples (SB designation), including QA/QC samples, were collected from the QMCP in accordance with the SAP. EGLE's GSS utilized a track-mounted direct-push drill rig to retrieve continuous soil cores from the subsurface by advancing a 5-foot long, 1.5-inch diameter Macro-Core sampler to the desired depth. Borings were advanced into the groundwater table and subsurface soil samples collected for laboratory analysis were selected based on field screening results and visual or olfactory indication that contamination may be present. The lithology for each boring was classified by the field geologist in accordance with the Unified Soil Classification System (USCS) and recorded on the field log and screened with a photoionization detector (PID). Subsurface soil samples were collected from the vadose zone and select borings were chosen for the collection of groundwater samples based on field observations.

The samples were submitted under chain-of-custody to EGLE's Environmental Laboratory in Lansing, Michigan for analysis as outlined in the SAP. Each of the sample locations were located with a GPS unit with sub-meter accuracy and a description of the sampled material was documented on a field log. A photographic log, documenting representative sample collection activities, is included in **Appendix D, Photographic Log**. Completed boring logs are included in **Appendix E, Boring Logs**. A summary of the samples collected during the investigation, including their descriptions, requested analyses, and other relevant information is included on **Table 3-1, Sampling and Analysis Summary**. Sampling locations, analytical results, and findings are included in **Section 5** through **Section 14** of this SI Report.

### 3.2.5 Groundwater Sampling

Certain soil boring locations were selected to include the installation of a temporary groundwater sampling point. Groundwater samples were collected utilizing a Screen-Point-16 (SP-16) stainless steel screen reusable sampling rod and were collected from throughout the QMCP. At some locations existing monitoring wells were sampled. A total of 26 groundwater samples (GW or MW designation), including QA/QC samples, were collected from the QMCP in accordance with the SAP.

During sample collection with the SP-16, the downhole sampling tools were advanced into the water-bearing zone in the boring and the outer rod was withdrawn to expose the internal stainless steel screen. A low-flow peristaltic pump with disposable Teflon tubing was used to collect a grab groundwater sample from the screened sample interval of the SP-16 or existing monitoring well. Field parameters for dissolved oxygen (DO), pH, oxidation reduction potential (ORP), conductivity, temperature, and turbidity were measured with a water-quality monitoring instrument equipped with a flow-through cell at the time of groundwater sample collection. Groundwater samples were pumped directly into laboratory-provided sample jars. Sample jars were then labeled and placed in a cooler on ice for transportation under chain of custody to EGLE's Environmental Laboratory in Lansing, Michigan for analysis as outlined in the SAP.

Each of the sample locations were located with a GPS unit with sub-meter accuracy and a description of the sample interval documented on a field log. A photographic log documenting representative sample collection activities is included in **Appendix D, Photographic Log**. GSS-completed boring logs documenting the temporary well screen intervals are included in **Appendix E, Boring Logs**. A summary of the samples collected during the investigation, including their descriptions, requested analyses, and other relevant information is included on **Table 3-1, Sampling and Analysis Summary**. Sampling locations, analytical results, and findings are included in **Section 5** through **Section 14** of this SI Report.

### 3.2.6 Sediment Sampling

Select sediment sampling locations were predetermined in the SAP based on the evaluations and assessments presented in **Section 3.1**. Other sediment sampling locations presented in the SAP were subject to change based on the findings of the underwater surveillance. These locations were moved with the intent of collecting material from the interior of submerged containers or from identified waste deposits based on GSS's underwater imagery targeting, a key element of the SI distinguishing it from previous investigations.

Sediment samples were collected from the Portage Canal and Dollar Bay. A total of 30 sediment samples (SD and SS designations), including QA/QC samples, were collected from the QMCP in accordance with the SAP, 17 of which were offshore from subareas included in this SI Report. Sediment samples were collected utilizing the EGLE GSS's vibracore sampler. Polycarbonate tubing was advanced into the sediment using the vibrating drive head. The extracted sample core was opened, the sediment column logged, samples were collected using the prescribed intervals in the SAP or visual observations, including physical characteristics and staining, or olfactory evidence of contamination within the sediment sample core. The lithology for each sediment core was classified by the field geologist in accordance with the USCS and recorded on the field log. Sediment samples were transferred directly into laboratory-provided sample jars. Sample jars were then labeled and placed in a cooler on ice for transportation to the analytical laboratory under chain of custody. Offshore samples were maintained separately from terrestrial samples.

Each of the sample locations were located with a GPS unit with sub-meter accuracy and a description of the sample core was documented on a field log. A photographic log, documenting representative sample collection activities, is included in **Appendix D, Photographic Log**. Completed sediment logs are included in **Appendix F, Sediment Core Logs**. A summary of the samples collected during the SI, including their descriptions, requested analyses, and other relevant information is included on **Table 3-1, Sampling and Analysis Summary**. Sampling locations, analytical results, and findings are included in **Section 15** of this SI Report.

### 3.2.7 Decontamination Procedures and Management of Investigative Derived Wastes

Investigative-derived wastes (IDW) include the byproducts of the field activities, including excess sample media, spent sampling supplies, and expendable personal protective equipment (PPE). The following paragraphs describe the procedures used during the SI to manage IDW and decontaminate equipment used during the investigation.

During implementation of the terrestrial investigation soil cuttings, purge water, and decontamination water were generated. Soil cuttings, following logging, screening, and sampling, were returned to the boring by EGLE. For locations where groundwater samples were collected, the soil cuttings were temporarily staged until all samples were collected and the sampling equipment was extracted from the boring. Excess groundwater generated during sample collection was discharged to the ground surface by EGLE. Following groundwater sampling, the boring was backfilled with the staged soil cuttings. Expendable groundwater sampling materials were containerized in a trash bag for disposal as non-hazardous municipal solid waste by EGLE at the end of the project phase. Reusable equipment, including the stainless steel sampling screen, was decontaminated between boring locations. Decontamination water generated through washing and rinsing was discharged to the ground surface in the vicinity of the sampling locations. Spray bottles of wash and rinse water were used to minimize the volume of decontamination fluids generated by the soil boring and well installation activities.

Implementation of the offshore sampling activities resulted in the generation of similar waste streams. Spent polycarbonate tubing used in the collection of vibracore sediment samples, spent sampling supplies, and PPE were temporarily staged on the sampling vessel until the vessel returned to the dock. Upon returning to shore, the staged waste was transferred to a dumpster by EGLE for disposal. Excess sediment, debris, and surface water generated as a result of the sampling activities were returned to the lake in the vicinity of the sample location by EGLE.

Reusable equipment was decontaminated on board the sampling vessel using an Alconox™ wash and rinse. Spray bottles of wash and rinse water were used to minimize the volume of decontamination fluids generated during the sediment sampling activities. Decontamination water generated through washing and rinsing was discharged to the lake in the vicinity of the sample location.

### 3.2.8 Sample Handling, Tracking, and Custody Procedures

All samples were identified, handled, shipped, tracked, and maintained under chain of custody as prescribed in the SAP. The following paragraphs summarize the sample management and tracking activities used during implementation of the SI.

Samples collected during the SI were given a unique sample identification (ID) number that was project- and location-specific. A record of sample ID numbers was kept with the field records and recorded on chain-of-custody forms. Sample labels using the nomenclature defined in the SAP were affixed to sample containers. After labeling, each sample was placed in a cooler with ice for transportation to the specified laboratory. Field documentation, including sampling forms, maps, and field logs were maintained in a field binder maintained by EGLE and MSG field personnel.

The field team used laboratory-provided sample custody forms to maintain and document sample integrity during sample collection, transportation, and storage. The chain of custody forms were used to document samples collected and the analyses requested. Chain of custody procedures documented the possession of individual samples from the time of collection in the field to the time of acceptance at the laboratory. Copies of the chain of custody records and the air bills (as needed) were retained and placed in the EGLE project file.

Laboratory chain-of-custody began with sample receipt and continued until samples were discarded. Sample coolers were generally hand delivered to the laboratory where a designated sample custodian received the incoming samples. The laboratory sample custodian recorded pertinent information associated with the samples, including the person(s) delivering the samples, the date and time received, and sample condition at the time of receipt (sealed, unsealed, or broken container; temperature; and other relevant remarks).

Investigative samples were delivered by a courier or shipped under chain of custody to the laboratories listed in the table below.

| Matrix                                                                      | Laboratory Name               | Laboratory Address                                         | Laboratory Contact Name                         | Laboratory Phone Number |
|-----------------------------------------------------------------------------|-------------------------------|------------------------------------------------------------|-------------------------------------------------|-------------------------|
| Surface Soil<br>Subsurface Soil<br>Groundwater<br>Surface Water<br>Sediment | EGLE Environmental Laboratory | 3350 N. Martin Luther King Blvd.<br>Lansing, MI 48906-2933 | EGLE Laboratory Services Section<br>Kirby Shane | (517) 335-9800          |
| Bulk Asbestos and Asbestos in Soil                                          | Eurofins TestAmerica, Inc.    | 4101 Shuffel Street NW<br>North Canton, OH 44720           | Kris Brooks                                     | (330) 966-9790          |

The EGLE Environmental Laboratory does not perform asbestos analyses. As a result, the samples were shipped under chain of custody and managed by the EGLE Environmental Laboratory to a contract laboratory under the Contract Laboratory program.

### 3.2.9 QA/QC

All samples were collected and analyzed using the field and laboratory quality control procedures prescribed in the SAP. The following paragraphs summarize the field and laboratory quality control procedures utilized during implementation of the SI.

QC samples were collected to evaluate the field sampling methods and the overall reproducibility of the laboratory analytical results. Field duplicate samples were collected, processed, stored, packaged, and analyzed by the same methods as the investigative samples. QC for analytical procedures were performed in accordance with the laboratories' standard operating procedures (SOP).

Matrix spike/matrix spike duplicate (MS/MSD) samples were not collected during the implementation of field activities. Alternatively, MS/MSD samples were selected by the laboratory and "batched". As such, MS/MSD samples were not necessarily derived from investigative samples from the Project, but may have come from another sample set at the laboratory. MS/MSD results were reported with investigative sample results.

The EGLE Environmental Laboratory and their contracted laboratories provided analytical results in electronic data deliverable (EDD) and report formats, with QA/QC data included (case narrative, investigated data results summary, and QC sample summary results). Laboratory-generated data was imported to the Project database for mapping, reporting, and archival activities. Laboratory analytical reports are included in **Appendix G, Laboratory Analytical Reports**.

## 4. EXPOSURE ASSESSMENT

This Section presents the human health and ecological exposure criteria that are applicable to the QMCP. The discussions included in the following subsections assist in framing the results presented in the detailed findings included in **Section 5** through **Section 15** with respect to the current land use and the anticipated future land use within the QMCP.

### 4.1 EGLE FACILITY DEFINITION

As defined in Section 20101(1)(s) of Part 201 of Michigan's Natural Resources and Environmental Protection Act (NREPA), being Public Act (PA) 451 of 1994, as amended, a "Facility" means any area, place, parcel or parcels of property, or portion of a parcel of property where a hazardous substance in excess of the concentrations that satisfy the cleanup criteria for unrestricted residential use has been released, deposited, disposed of, or otherwise comes to be located. Facility does not include any area, place, parcel or parcels of property, or portion of a parcel of property where any of the following conditions are satisfied:

(i) Response activities have been completed under this part or the Comprehensive Environmental Response, Compensation, and Liability Act, 42 United States Code (USC) 9601 to 9675, that satisfy the cleanup criteria for unrestricted residential use.

(ii) Corrective action has been completed under the resource conservation and recovery act, 42 USC 6901 to 6992k, part 111, or part 213 that satisfies the cleanup criteria for unrestricted residential use.

(iii) Site-specific criteria that have been approved by the department for application at the area, place, parcel of property, or portion of a parcel of property are met or satisfied and hazardous substances at the area, place, or property that are not addressed by site-specific criteria satisfy the cleanup criteria for unrestricted residential use.

(iv) Hazardous substances in concentrations above unrestricted residential cleanup criteria are present due only to the placement, storage, or use of beneficial use by-products or inert materials at the area, place, or property in compliance with part 115.

(v) The property has been lawfully split, subdivided, or divided from a facility and does not contain hazardous substances in excess of concentrations that satisfy the cleanup criteria for unrestricted residential use.

(vi) Natural attenuation or other natural processes have reduced concentrations of hazardous substances to levels at or below the cleanup criteria for unrestricted residential use.

Note that in Section 20101(1)(x) of Part 201, hazardous substance does not include by definition stamp sands, which are defined as "finely grained crushed rock resulting from mining, milling, or smelting of copper ore and includes native substances contained within the crushed rock and any ancillary material associated with the crushed rock." Section 20101c goes on to further state that "Property onto which stamp sands have been deposited is not subject to regulation under this part unless the property otherwise contains hazardous substances in excess of concentrations that satisfy the cleanup criteria for unrestricted residential use."

From a terrestrial standpoint, chemical concentrations detected in soil and groundwater in the QMCP exceed residential exposure criteria for one or more COCs. Analytical results and their implications on facility status are described further in the detailed findings in **Section 5** through **Section 14**, which documents portions of the QMCP as being a facility. It should be noted however, that the QMCP is comprised of multiple land parcels and owners.

## 4.2 APPLICABLE SCREENING CRITERIA

In support of developing a comprehensive approach for evaluating risks, the analytical results from previous investigations and this SI were compiled and compared to the following regulatory screening criteria that were in place at the time of Project completion:

- Part 201 of NREPA, being PA 451 of 1994, as amended Residential and Nonresidential Cleanup Criteria for Response Activity (updated, June 25, 2018).
  - Surface Soil;
  - Subsurface Soil;
  - Abandoned Container Contents;
  - RPM;
  - Groundwater; and,
  - Asbestos.
- EPA, National Emission Standards for Hazardous Air Pollutants (NESHAP) (40 CFR, Part 61, Subpart M) (EPA 1984).
  - Asbestos.
- EPA, Region 4, Ecological Screening Values (ESVs) (EPA 2018).
  - Sediment; and,
  - Surface Water.
- EGLE – Rule 57 Water Quality Values, Surface Water Assessment Section (February 2020).
  - Surface Water.
- Sediment Quality Guidelines, Threshold Effect Concentrations (TECs) and Probable Effect Concentrations (PECs) (MacDonald, et al, 2000).
  - Sediment.

It should be noted that while EGLE's Media-Specific Volatilization to Indoor Air Interim Action Screening Levels (MSSLs) were used for screening purposes in evaluating the limits of contamination, they were not used for evaluation of exposure pathway exceedances in the Detailed Findings in **Section 5** through **Section 14**. The EGLE MSSLs are not promulgated rules, and cannot be used for a "Facility" determination, compliance, or for obtaining closure of a release. The regulatory screening criteria summarized above may be applicable to all or select portions of the QMCP. Limiting factors in the assessment of the applicability of these criteria may include, but are not limited to, specific environmental media (as noted above), current and anticipated future land use categories, and relevant exposure pathways for human and ecological receptors. Assessment of these factors requires that the analytical results of the SI and the respective geological and hydrogeological characteristics of the Project area be evaluated to determine generally which exposure pathways, risks, and conditions are relevant and applicable. The following subsections present the criteria assessment rationale and applicability determinations for identified exposure pathways in the QMCP.

#### **4.2.1 Non-Evaluated Exposure Pathways**

The following exposure pathway was not evaluated at the QMCP:

- Risks to aesthetic characteristics of the affected media.

Although contaminated media has the potential to have impacts on aesthetics, this pathway was not assessed because assessment of potential risks to flora, fauna, the food chain, and aesthetics was beyond the scope of the evaluation. The comprehensive evaluation presented in this SI is aimed at determining if a release has occurred and whether or not human health and ecological risks are posed by any such release as they relate to current land use within the QMCP.

#### **4.2.2 Non-Applicable Exposure Pathways**

The following exposure pathways are not applicable at the QMCP:

- Risks due to free-phase liquids.

Free-phase liquids, released to the environment, have not been identified at the QMCP.

#### **4.2.3 Relevant Exposure Pathways Where Applicable Criteria Are Not Exceeded**

The following exposure pathways are relevant at the QMCP, but the maximum detected contaminant concentrations do not exceed applicable exposure criteria:

- Risks posed by hazardous substances in groundwater that may result in flammable or explosive conditions to be present in both residential and nonresidential settings.
- Risks posed by hazardous substances in soil that may result in the volatilization of contaminants to indoor air in nonresidential settings.
- Risks posed by hazardous substances in soil that may result in the volatilization of contaminants to ambient air in residential and nonresidential settings.

#### **4.2.4 Relevant Exposure Pathways Where Criteria Are Exceeded, But Pathway Is Incomplete**

The following exposure pathways are relevant at the QMCP, but the exposure pathway is currently incomplete:

- Risks posed by hazardous substances that are covered or capped with soil and or a vegetative cover.
  - Multiple properties in the QMCP feature capped and vegetated areas along the shoreline of the Portage Canal and Dollar Bay. These properties include vacant and industrial or commercial properties that may or may not have been included in previous remedial actions in the area. Land use on these properties varies, but may include recreational or remain undeveloped. Risks may be present in these areas where cap material has covered potential hazardous materials.

#### 4.2.5 Relevant Exposure Pathways Where Applicable Criteria Are Exceeded and Pathway is Complete

The following exposure pathways are relevant at the QMCP and the exposure pathways are potentially complete:

- Risks posed by hazardous substances in soil and the potential for the substances to leach to groundwater that could be used as a drinking water source in both residential and nonresidential settings.
- Risks posed by hazardous substances in soil and the potential for the substances to leach to groundwater that could vent to surface water.
- Risks posed by hazardous substances in soil and the potential for the substances to be inhaled if they are emitted as particulates and dispersed in ambient air in both residential and nonresidential settings.
- Risks posed by hazardous substances in soil and the potential for direct contact with these soils in both residential and nonresidential settings.
- Risks posed by hazardous substances in soil that may result in the volatilization of contaminants to indoor air in residential settings.
- Risks posed by hazardous substances in groundwater and the potential for that groundwater to be used as a drinking water source in both residential and nonresidential settings.
- Risks posed by hazardous substances in groundwater that may result in the volatilization of contaminants to indoor air in both residential and nonresidential settings.
- Risks posed by hazardous substances in groundwater and the potential for that groundwater to vent to surface water.
- Risks posed by hazardous substances in surface water and sediments that have the potential to have toxic effects on aquatic biota and/or enter the food chain.

Although relevant, EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the soil and groundwater evaluation in the detailed findings included in **Section 5** through **Section 14**. The rationale for this exclusion is twofold:

- The Project investigation and anticipated response actions are being undertaken pursuant to Part 201 of Michigan's NREPA, being PA 451 of 1994, as amended. The concentrations of metals in excess of EGLE drinking water and surface water pathway criteria are ubiquitous in the study area and are predominantly the result of the presence of stamp sands. Stamp sands are not defined as a hazardous substance nor are they subject to regulation under Part 201 unless the property otherwise contains hazardous substances in excess of concentrations that satisfy the cleanup criteria for unrestricted residential use; and,
- The study area is part of OU 2 for which the EPA ROD remedy called for No Action. The EPA's ROD for OU 2 includes groundwater, surface water, submerged tailings and sediments in Torch Lake, Portage Lake, the Portage Canal, and other area water bodies. Note that EPA's No Action determination relies on the following to mitigate the effects of stamp sand to the extent practicable:
  - The reduction of stamp sand loading to surface water bodies expected as a result of the remedial action taken at OU 1 and OU 3.
  - Ongoing natural sedimentation and detoxification.

- Institutional programs and practices controlling potential future exposure to site-affected drinking water that were intended to be administered at the county and state level.
- The long-term monitoring and the five-year review process monitoring requirements of the remedy selected for OU 1 and OU 3 under the 1992 ROD.

Note that metals criteria for other relevant pathways, and organic and cyanide contaminants for all pathways were included in the evaluation.

EGLE's MSSLs may be applicable to all or a select portion of QMCP; however, due to limiting factors as discussed in **Section 4.2**, including unknown anticipated future land use and conditions, the screening levels were excluded from the exposure assessment for each subarea. As noted above, the screening levels are not promulgated rules and cannot be used for "Facility" determination or compliance.

#### **4.2.6 Relevant Cleanup Criteria for Hazardous Substances in Contaminated Environmental Media Not Accounted for by Other Rules**

To assure that hazardous substances in contaminated environmental media do not pose unacceptable risks not accounted for by other rules in Part 201, the concentration of a hazardous substance in a given environmental medium shall meet cleanup criteria based on sound scientific principles and determined by EGLE to be necessary to protect the public health, safety, and welfare and the environment.

The following, not accounted for by other rules in this part, are relevant at the QMCP:

- Risks posed by physical hazards.
- Risks posed by hazardous substances in surface soil that may result from the direct transport or runoff of hazardous substances in soil into surface water.
- Risks posed by hazardous substances in waste and abandoned containers that may result from the direct transport or runoff of hazardous substances into soil, groundwater, and surface water.

### **4.3 CONCEPTUAL SITE MODEL**

The applicable regulatory criteria and the relevant exposure pathways assessed in the preceding subsections indicate that COCs are present in various environmental media in the QMCP. COCs have been identified in surface and vadose zone soils, groundwater, pore water, sediment, and submerged drum contents that have the potential to affect human and ecological receptors, as well as recreational users or consumers of the natural resources of the Portage Canal. Further, the potential for particulate migration and dispersion through the air from surface soils poses additional risks.

The current and foreseeable land use in the QMCP includes both residential and nonresidential uses; however, historical documentation indicates that this area was highly industrialized through the 1960s. The extent of these operations included both terrestrial and offshore operations that included the discharge of wastes and debris to the Portage Canal. The eventual end of mining era operations and the generally undocumented transition of these properties to alternative uses likely resulted in the redistribution of surface soils and potentially contaminants along the shoreline. Further, underwater abandoned containers have been visually documented in the nearshore environment. Physical hazards are also posed by residual mining era related conditions.

A Conceptual Site Model (CSM) was developed for the general QMCP to graphically present the relevant exposure pathways summarized in **Section 4.2** and their relationship to the distribution of contaminants in the nearshore (terrestrial and offshore) environment throughout the QMCP. While the CSM was developed for the QMCP, each

individual parcel identified and addressed as part of the SI investigation is unique and may require a property-specific risk assessment based on current and anticipated future land-use. The QMCP CSM represented in **Appendix H**, *Conceptual Site Model – Exposure Pathway Evaluation* depicts these relationships under both residential and nonresidential land use scenarios.

## 5. DETAILED FINDINGS – AREA A

This Section summarizes the results and the subsequent findings for Area A within QMCP derived from implementation of the SAP. The narrative follows the systematic investigative approach outlined in **Section 3**, while providing specific details about the potential human health and ecological risks associated with the historical mining operations in this subarea of QMCP.

### 5.1 SITE INSPECTION AND INVESTIGATION RESULTS

The implementation of the site inspection and investigation activities provided critical lines of evidence that link the historical documentation and the current environmental conditions in and around the Portage Canal. The following subsections present the findings of the inspection and investigation activities and provide correlation of mining era operations and their potential impacts on the nearshore environment of the Portage Canal.

#### 5.1.1 Site Inspection

The site inspection at each subarea included the inventory and locating of historical structures and similar surficial artifacts associated with the former industrial operations in the area. Each subarea was also inspected for potential physical and health hazards that were documented, photographed, and located with a GPS unit. The inventoried hazards were then qualitatively assessed for potential human health and environmental risks to determine if analytical sampling was warranted during the targeted inspection phase of the work.

On September 13, 2018, MSG field team personnel performed reconnaissance activities at Area A. In the cases where access was not requested based on historic operational and investigative findings, property conditions were evaluated from a neighboring property or public right of way where access was permitted. Access to Area A was not requested based on historic operational and investigative findings.

Therefore, the property parcel known as the Houghton County Marina totaling approximately nine acres was visually inspected and observations were recorded from the MDNR trail property. The qualitative assessment of the reconnaissance findings in Area A did not warrant the performance of targeted inspection activities. The following provides a summary of the findings associated with the reconnaissance activities. A summary of identified potentially abandoned containers is provided in **Appendix C, Site Inspections – Reconnaissance Logs, Targeted Inspections & Physical Hazards Inventory**.

##### 5.1.1.1 Reconnaissance

During the reconnaissance activities potentially abandoned containers were observed inside the fence at the Houghton County Marina. Observed contents in open buckets appeared to be used oil. The qualitative assessment of the reconnaissance findings in Area A did not warrant the performance of limited targeted inspection activities.

#### 5.1.2 Site Investigation

The SI in the QMCP was developed based on a variety of data and information as outlined in **Section 3**. In addition to the historical accounts and documentation, current land use and potential exposure pathways were also taken into consideration when selecting the sampling locations specific to Area A. Additional sampling in Area A as part of this SI was not completed; however, proposed investigative locations that were not sampled during the 2018/2019 mobilizations could be completed during future SI activities. A summary of planned investigative locations, sampling rationale, and other relevant information is included on **Table 3-1, Sampling and Analysis Summary** of this SI Report. Detailed summaries of historic soil and groundwater analytical results collected from Area A are provided in **Table 5-1, Summary of Soil Analytical Results (Area A)** and **Table 5-2, Summary of Groundwater Analytical Results (Area A)**,

respectively. Soil and groundwater analytical results are depicted on **Figure 5-1, Soil Analytical Results (Area A)** and **Figure 5-2, Groundwater Analytical Results (Area A)**.

## 5.2 NATURE AND EXTENT OF CONTAMINATION

Utilizing the established regulatory criteria presented in **Section 4** for various land use categories and exposure pathways, the historic laboratory analytical results for Area A were reviewed and compared to the EGLE Cleanup Criteria Requirements for Response Activity as applicable for the sampled environmental media.

### 5.2.1 Comprehensive Exposure Assessment

The comparison was completed to determine which ecological and human exposure pathways, risks, and conditions are relevant in Area A. Although not inclusive of relevant pathways where regulatory criteria were not exceeded, the following exposure pathways were determined to be relevant in Area A:

- Risks posed by hazardous substances in soil and the potential for the substances to leach to groundwater that could be used as a drinking water source in both residential and nonresidential settings.
- Risks posed by hazardous substances in soil and the potential for the substances to leach to groundwater that could vent to surface water.
- Risks posed by hazardous substances in soil that may result in the volatilization of contaminants to indoor air in residential and nonresidential settings.
- Risks posed by hazardous substances in groundwater and the potential for that groundwater to be used as a drinking water source in both residential and nonresidential settings.
- Risks posed by hazardous substances in groundwater that may result in the volatilization of contaminants to indoor air in both residential and nonresidential settings.
- Risks posed by hazardous substances in groundwater and the potential for that groundwater to vent to surface water.
- Risks posed by hazardous substances in groundwater that may exceed solubility limits.

As discussed in **Section 4.2.5**, EGLE drinking water and groundwater/surface water pathway criteria exceedances for metals were excluded from the soil and groundwater evaluation. The rationale for this exclusion is twofold:

- The Project investigation and anticipated response actions are being undertaken pursuant to Part 201 of NREPA, being PA 451 of 1994, as amended. The concentrations of metals in excess of the EGLE drinking water and groundwater/surface water interface pathway criteria are ubiquitous in the study area and are predominantly the result of the presence of stamp sands. Stamp sands are not defined as a hazardous substance nor are subject to regulation under Part 201 unless the property otherwise contains hazardous substances in excess of concentrations that satisfy the cleanup criteria for unrestricted residential use; and,
- The study area is part of OU 2 for which the EPA ROD remedy called for No Action. The EPA's ROD OU 2 includes groundwater, surface water, submerged tailings and sediments in Torch Lake, Portage Lake, the Portage Canal, and other area water bodies. Note that EPA's No Action determination relies on the following to mitigate the effects of stamp sand to the extent practicable:

- The reduction of stamp sand loading to surface water bodies expected as a result of the remedial action taken at OU 1 and OU 3.
- Ongoing natural sedimentation and detoxification.
- Institutional programs and practices controlling potential future exposure to site-affected drinking water which were intended to be administered at the county and state level.
- The long-term monitoring and the five-year review process monitoring requirements of the remedy selected for OU 1 and OU 3 under the 1992 ROD.

Note that metals criteria for other relevant pathways, and cyanide and organic contaminants for all pathways were included in the evaluation.

Furthermore, as discussed in **Section 4.2.5**, EGLE's MSSSLs were not included in the exposure pathway assessment due to unknown anticipated future land use and conditions and because the screening levels are not promulgated rules. The MSSSLs were considered for screening and delineation purposes only.

#### *5.2.1.1 Soil Exposure Pathway Assessment*

Historical soil analytical results from Area A identified COC concentrations in soil that were at or above concentrations that trigger a "Facility" designation as defined in Section 20101(1)(s) of the NREPA. The following tables provide an aggregate summary of the historic soil sample locations with respect to the total number of samples and how they compare to the applicable EGLE Cleanup Criteria for Response Activity under both Residential and Nonresidential exposure scenarios.

The tables are based solely on the total number of samples, inclusive of historical samples, collected from Area A. They list only the number of samples for a specific analytical suite that contained one or more exceedance of a given criterion.

| Soil Analytical Result Summary Table                                 | Cleanup Criteria Requirements for Response Activity – Residential** |                    |                    |                                                |                                                         |                                                       |                                                          |                                          |                                          |                                      |                         |                                                |

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the soil evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSLS or non-applicable criteria (DWPC and GSIPC for metals).

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the soil evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSLS or non-applicable criteria (DWPC and GSIPC for metals).

#### 5.2.1.2 Groundwater Exposure Pathway Assessment

Groundwater analytical results from Area A identified COC concentrations in groundwater that were at or above concentrations that trigger a “Facility” designation as defined in Section 20101(1)(s) of the NREPA. Similar to the preceding soil tables, the following table provides a summary of the aforementioned sample locations with respect to the total number of samples and how they compare to the applicable EGLE Cleanup Criteria for Response Activity under both Residential and Nonresidential exposure scenarios.

| Groundwater Analytical Result Summary Table                          | Analytical Summary      |                                    |                    | Cleanup Criteria Requirements for Response Activity – Residential and Nonresidential**                                                                                                                          |                                        |                                              |                                                                          |                                                                             |                  |                                               |

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the groundwater evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSSLs or non-applicable criteria (DWC and GSIC for metals).

## 5.2.2 Extent of Contamination

The comparison of analytical results to applicable regulatory criteria indicates that potential human health and ecological risks are present in soil and groundwater at Area A. Recalling the goals and objectives of the SI, the following subsections describe the extent of contamination in environmental media in the study area.

### 5.2.2.1 Soil Extent of Contamination

Historical soil analytical results from Area A identified COC concentrations in soil that were at or above concentrations that trigger a “Facility” designation as defined in Section 20101(1)(s) of the NREPA.

Historic soil analytical results exceeded Groundwater/Surface Water Interface Protection Criteria (GSIPC), and/or soil MSSSLs for residential and/or nonresidential exposure scenarios in six samples. The predominant contaminants were SVOCs, VOCs, and some inorganic compounds, including cyanide and mercury.

Most historic samples were collected from surface and subsurface soil intervals in areas that are generally accessible to the public, including on MDNR trail property. The sampling locations were generally within approximately 250 ft of the shoreline of the Portage Canal.

Soils with elevated levels of inorganic COCs are ubiquitous in the area, which becomes a limiting factor when evaluating potential exposure pathways. In the case of Area A, elevated concentrations of inorganic and organic contaminants potentially include exposure risks related to inhalation pathways, which must be a consideration when evaluating land use, property accessibility, and the extent of contamination in surface and near surface soils that could be encountered through normal use of the property.

The remaining exposure risks are generally related to the leaching of contaminants to groundwater and their potential impacts on drinking water (if used as a drinking water source) and surface water. These risks pose a long-term threat to the overall environmental health of the watershed. The widespread distribution of inorganic COCs throughout the region limits determinations related to the extent of contamination in Area A. Nevertheless, risks posed to groundwater and surface water are relevant and are a factor when evaluating the extent of soil contamination in the QMCP.

#### *5.2.2.2 Groundwater Extent of Contamination*

Historic groundwater analytical results at certain locations exceeded Drinking Water Criteria (DWC) for both residential and nonresidential exposure scenarios, and Groundwater/Surface Water Criteria (GSIC) for primarily organic contaminants. In addition, SVOCs and/or VOCs exceeded Groundwater Volatilization to Indoor Air Criteria (VIAC) and/or MSSLs at four of the sampled locations. Review of historic documentation indicated analysis for PCBs did not occur and only one sample was analyzed for inorganic constituents (lead). Water solubility criteria was exceeded at one historic location (MW-113), indicating the potential for light-non aqueous phase liquids (LNAPL) which has not been identified or defined.

Groundwater sample intervals and monitoring well depths were not available for evaluation; however, near-shore sample locations are assumed to generally have a shallow water table.

The potential risks associated with groundwater as a drinking water source as well as its connectivity to nearby surface water bodies should be a consideration in determinations related to the extent of contamination in Area A.

### **5.3 CONCLUSIONS AND RECOMMENDATIONS**

The analytical results and interpretation summarized in the preceding subsections document potential human health and ecological risks that are present in Area A. The following subsections provide a synopsis of these findings and a recommended path forward for addressing these risks in Area A.

#### **5.3.1 Conclusions**

Environmental impacts in Area A are generally characterized by detections of organic and inorganic contaminants in soil and groundwater. Although specific sources of these contaminants may not be fully understood, research related to the historical operations provided substantive evidence for assessing specific operational areas and selecting target analytes anticipated to be present within the study area.

The historic analytical results summarized above provide sufficient analytical data and lines of evidence to conclude that the study area is a Facility as defined in Section 20101(1)(s) of the NREPA. The following table provides a summary of the affected environmental media, applicable regulatory criteria, and potential receptors within Area A.

| Area A – Media, Criteria, Potential Receptor Summary                 |                           |                                     |                |                                                                                                                                                                                                                          |                                     |                              |                |                        |            |               |              |                                                        |                              |               |

The following provides a summary of findings derived from the assessment of Area A with respect to the goals and objectives for the Project:

- Terrestrial sources of contamination are present in the form of inorganic COCs, cyanide, VOCs, and SVOCs in the study area. The analytical data is historic, the extent of contamination in Area A has not been fully defined or addressed, and the potential for LNAPL near MW-113 has not been investigated.
- Soil impacts on the MDNR trail property exceeded GSI PC and MSSSLs for residential and nonresidential scenarios but did not exceed particulate soil inhalation criteria (PSIC) or DCC.

### 5.3.2 Recommendations

The conclusions outlined in the preceding subsection establish that Area A is a Part 201 Facility. Section 20107a of Part 201 of NREPA describes the duties of owners or operators of a Facility, regardless of their liability, including: prevent unacceptable exposures, prevent exacerbation, and take reasonable precautions against the foreseeable actions of third parties. Some exceptions may apply; in any case, owners and operators of contaminated properties should become familiar with Section 20107a and the associated Rules.

Abandoned Mining Wastes - Torch Lake Non-Superfund Site

Soil Table Footnotes:

- EGLE Part 201 residential and non-residential generic cleanup criteria and screening levels criteria were originally promulgated December 21, 2002 within the Administrative Rules for Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. This table reflects revisions to the criteria pursuant to the December 2010 Part 201 amendments and new criteria consistent with the provisions of R299.5706a. Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. Release Date: December 30, 2013. Updated June 2018.

- Only detected analytes are listed - Gray rows indicate requested analyses. If no analytes are listed below a gray row then all analytes of that group were either not analyzed or not detected.

- **Bold** values are concentrations detected above the laboratory reporting limit.

- **Bold/Shaded** cells indicate analyte concentration exceeded applicable criteria. EGLE Part 201 criteria exceeded is indicated by the footnote in [brackets] following the result value and defined below:

|                                                                                |                                                                                    |

Evaluation based on EGLE Criteria at time of Project completion.

Samples described in this evaluation may actually refer to stamp sands or to other mining waste from the historic mining and reclamation processes conducted in the area.

|                                  |                                                                                   |
|----------------------------------|-----------------------------------------------------------------------------------|
| -- = No Exceedances              | PCBs = Polychlorinated biphenyls                                                  |
| NM = Not Measured                | VOC = Volatile organic compound                                                   |
| ND = Not Detected                | SVOC = Semi-volatile organic compound                                             |
| bgs = Below ground surface       | MSSL = Media-Specific Volatilization to Indoor Air Interim Action Screening Level |
| ft = Feet                        | ug/kg = Micrograms per kilogram                                                   |
| in = Inches                      | % = Percentage                                                                    |
| mg/kg = Milligrams per kilogram. |                                                                                   |

Criteria Footnotes:

ID = Insufficient data to develop criterion.

NA = A criterion or value is not available

NLL = Hazardous substance is not likely to leach under most soil conditions.

(B) = Background, as defined in R 299.1(b), may be substituted if higher than the calculated cleanup criterion. Background levels may be less than criteria for some inorganic compounds.

(BB) = The state drinking water standard for asbestos (fibers greater than 10 micrometers in length) is in units of a million fibers per liter of water (MFL). Soil concentrations of asbestos are determined by polarized light microscop.

(C) = The criterion developed under R 299.20 to R 299.26 exceeds the chemical- specific soil saturation screening level (Csat). The person proposing or implementing response activity shall document whether additional response activity is required to control free-phase liquids or NAPL to protect against risks associated with free-phase liquids by using methods appropriate for the free-phase liquids present. Development of a site-specific Csat or methods presented in R 299.22, R 299.24(5), and R 299.26(8) may be conducted for the relevant exposure pathways.

(D) = Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).

(DD) = Hazardous substance causes developmental effects. Residential direct contact criteria are protective of both prenatal and postnatal exposure. Nonresidential direct contact criteria are protective for a pregnant adult receptor.

(F) = Criterion is based on adverse impacts to plant life and phytotoxicity.

(G) = Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. Where water hardness exceeds 400 mg Ca/L, use 400 mg CaCO<sub>3</sub>/L for the FCV calculation. The FCV formula provides values in units of ug/L or ppb.

The generic GSI criterion is the lesser of the calculated FCV, the wildlife value (WV), and the surface water human non-drinking water value (HNDV). The soil GSI protection criteria for these hazardous substances are the greater of the 20 times the GSI criterion or the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote. A spreadsheet that may be used to calculate GSI and GSI protection criteria for (G)-footnoted hazardous substances is available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. A hardness value of 47.5 CaCO<sub>3</sub>/L and pH of 7, derived from the Michigan Department of Environmental Quality Draft Site Inspection Report for Lake Linden Operations dated 3/29/13, was used in the footnote G calculation spreadsheet.

(H) = Valence-specific chromium data (Cr III and Cr VI) shall be compared to the corresponding valence-specific cleanup criteria. If both Cr III and Cr VI are present in groundwater, the total concentration of both cannot exceed the drinking water criterion of 100 ug/L. If analytical data are provided for total chromium only, they shall be compared to the cleanup criteria for Cr VI. Cr III soil cleanup criterion for protection of drinking water can only be used at sites where groundwater is prevented from being used as a public water supply, currently and in the future, through an approved land or resource use restriction.

(I) = Hazardous substance may exhibit the characteristic of ignitability as defined in 40 C.F.R. §261.21 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, Remediation and Redevelopment Division (RRD), 525 West Allegan Street, Lansing, Michigan 48933, at cost.

(J) = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations shall be added together for comparison to criteria.

(M) = Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.

(P) = Amenable cyanide methods or method OIA-1677 shall be used to quantify cyanide concentrations for compliance with all groundwater criteria. Total cyanide methods or method OIA-1677 shall be used to quantify cyanide concentrations for compliance with soil criteria. Nonresidential direct contact criteria may not be protective of the potential for release of hydrogen cyanide gas. Additional land or resource use restrictions may be necessary to protect for the acute inhalation concerns associated with hydrogen cyanide gas.

(Q) = Criteria for carcinogenic polycyclic aromatic hydrocarbons were developed using relative potential potencies to benzo(a)pyrene.

(R) = Hazardous substance may exhibit the characteristic of reactivity as defined in 40 C.F.R. §261.23 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost.

(T) = Refer to the federal Toxic Substances Control Act (TSCA), 40 C.F.R. §761, Subpart D and 40 C.F.R. §761, Subpart G, to determine the applicability of TSCA cleanup standards. Subpart D and Subpart G of 40 C.F.R. §761 (July 1, 2001) are adopted by reference in these rules and are available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulations may be purchased, at a cost as of the time of adoption of these rules of \$55, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401, or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost. Alternatives to compliance with the TSCA standards listed below are possible under 40 C.F.R. §761 Subpart D. New releases may be subject to the standards identified in 40 C.F.R. §761, Subpart G. Use Part 201 soil direct contact cleanup criteria in the published table if TSCA standards are not applicable.

(X) = The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information.)

(Z) = Mercury is typically measured as total mercury. The generic cleanup criteria, however, are based on data for different species of mercury. Specifically, data for elemental mercury, chemical abstract service (CAS) number 7439976, serve as the basis for the soil volatilization to indoor air criteria, groundwater volatilization to indoor air, and soil inhalation criteria. Data for methyl mercury, CAS number 22967926, serve as the basis for the GSI criterion; and data for mercuric chloride, CAS number 7487947, serve as the basis for the drinking water, groundwater contact, soil direct contact, and the groundwater protection criteria. Comparison to criteria shall be based on species-specific analytical data only if sufficient facility characterization has been conducted to rule out the presence of other species of mercury.

MSSL Footnotes:

J = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations must be added together for comparison to screening level.

JT = Hazardous substance may be present in several isomer forms. Screening levels may be used for the individual isomer provided that it is the sole isomer detected; however, when multiple isomers are detected in a medium, the isomer-specific concentrations must be added together and compared to the most restrictive screening level of the detected isomers.

M = The screening level may be below target detection limits (TDL).

Laboratory Footnotes:

J = The result is an estimated quantity.

U = Analyte analyzed for but not detected above the reported sample reporting limit.

UU = Analyte analyzed for but not detected above the reported sample reporting limit and is an estimated quantity.

Note: Analytical and Criteria Footnotes are included on the last page of the table.

TABLE 5-2  
Summary of Groundwater Analytical Results  
Area A  
Quincy Mining Company Portage Operations Area  
Abandoned Mining Wastes - Torch Lake Non-Superfund Site

Groundwater Table Footnotes:

- EGLE Part 201 residential and non-residential generic cleanup criteria and screening levels criteria were originally promulgated December 21, 2002 within the Administrative Rules for Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. This table reflects revisions to the criteria pursuant to the December 2010 Part 201 amendments and new criteria consistent with the provisions of R299.5706a. Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. Release Date: December 30, 2013. Updated December 21, 2020.

- Only detected analytes are listed - Gray rows indicate requested analyses. If no analytes are listed below a gray row then all analytes of that group were either not analyzed or not detected.

- **Bold** values are concentrations detected above the laboratory reporting limit.

- **Bold/Shaded** cells indicate analyte concentration exceeded applicable criteria. EGLE Part 201 criteria exceeded is indicated by the footnote in [brackets] following the result value and defined below:

|                                                                                   |                                                    |

Groundwater Table Footnotes:

ID = Insufficient data to develop criterion.

NA = A criterion or value is not available

NLV = Hazardous substance is not likely to volatilize under most conditions.

(A) = Criterion is the state of Michigan drinking water standard established pursuant to Section 5 of 1976 PA 399, MCL 325.1005.

(AA) = Use 10,000 ug/l where groundwater enters a structure through the use of a water well, sump or other device. Use 28,000 ug/l for all other uses.

(B) = Background, as defined in R 299.1(b), may be substituted if higher than the calculated cleanup criterion. Background levels may be less than criteria for some inorganic compounds.

(D) = Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).

(E) = Criterion is the aesthetic drinking water value, as required by Section 20120a(5) of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (NREPA). A notice of aesthetic impact may be employed as an institutional control mechanism if groundwater concentrations exceed the aesthetic drinking water criterion, but do not exceed the applicable health-based drinking water value provided in a table available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information)

(FF) = The chloride GSI criterion shall be 125 mg/l when the discharge is to surface waters of the state designated as public water supply sources or 50 mg/l when the discharge is to the Great Lakes or connecting waters. Chloride GSI criteria shall not apply for surface waters of the state that are not designated as a public water supply source, however, the total dissolved solids criterion is applicable.

(G) = Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. Where water hardness exceeds 400 mg CaCO<sub>3</sub>/L, use 400 mg CaCO<sub>3</sub>/L for the FCV calculation. The FCV formula provides values in units of ug/L or ppb. The generic GSI criterion is the lesser of the calculated FCV, the wildlife value (WV), and the surface water human non-drinking water value (HNDV). The soil GSI protection criteria for these hazardous substances are the greater of the 20 times the GSI criterion or the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote. A spreadsheet that may be used to calculate GSI and GSI protection criteria for (G)-footnoted hazardous substances is available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. A hardness value of 47.5 CaCO<sub>3</sub>/L and pH of 7, derived from the Michigan Department of Environmental Quality Draft Site Inspection Report for Lake Linden Operations dated 3/29/13, was used in the footnote G calculation spreadsheet.

(H) = Valence-specific chromium data (Cr III and Cr VI) shall be compared to the corresponding valence-specific cleanup criteria. If both Cr III and Cr VI are present in groundwater, the total concentration of both cannot exceed the drinking water criterion of 100 ug/L. If analytical data are provided for total chromium only, they shall be compared to the cleanup criteria for Cr VI. Cr III soil cleanup criterion for protection of drinking water can only be used at sites where groundwater is prevented from being used as a public water supply, currently and in the future, through an approved land or resource use restriction.

(HH) = The residential criterion for sodium is 230,000 ug/l in accordance with the Sodium Advisory Council recommendation and revised Groundwater Discharge Standards.

(I) = Hazardous substance may exhibit the characteristic of ignitability as defined in 40 C.F.R. §261.21 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, Remediation and Redevelopment Division (RRD), 525 West Allegan Street, Lansing, Michigan 48933, at cost.

(J) = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations shall be added together for comparison to criteria.

(L) = Criteria for lead are derived using a biologically based model, as allowed for under Section 20120a(9) of the NREPA, and are not calculated using the algorithms and assumptions specified in pathway-specific rules. The generic residential drinking water criterion of 4 ug/L is linked to the generic residential soil direct contact criterion of 400 mg/kg. A higher concentration in the drinking water, up to the state action level of 15 ug/L, may be allowed as a site-specific remedy and still allow for drinking water use, under Section 20120a(2) and 20120b of the NREPA if soil concentrations are appropriately lower than 400 mg/kg. If a site-specific criterion is approved based on this subdivision, a notice shall be filed on the deed for all property where the groundwater concentrations will exceed 4 ug/L to provide notice of the potential for unacceptable risk if soil or groundwater concentrations increase.

Acceptable combinations of site-specific soil and drinking water concentrations are presented in a table available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site (See R 299.49 Footnotes for generic cleanup criteria tables for additional information).

(M) = Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.

(Q) = Criteria for carcinogenic polycyclic aromatic hydrocarbons were developed using relative potential potencies to benzo(a)pyrene.

(S) = Criterion defaults to the hazardous substance-specific water solubility limit.

(T) = Refer to the federal Toxic Substances Control Act (TSCA), 40 C.F.R. §761, Subpart D and 40 C.F.R. §761, Subpart G, to determine the applicability of TSCA cleanup standards. Subpart D and Subpart G of 40 C.F.R. §761 (July 1, 2001) are adopted by reference in these rules and are available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulations may be purchased, at a cost as of the time of adoption of these rules of \$55, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401, or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost. Alternatives to compliance with the TSCA standards listed below are possible under 40 C.F.R. §761 Subpart D. New releases may be subject to the standards identified in 40 C.F.R. §761, Subpart G. Use Part 201 soil direct contact cleanup criteria in the published table if TSCA standards are not applicable.

(X) = The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information.)

(Z) = Mercury is typically measured as total mercury. The generic cleanup criteria, however, are based on data for different species of mercury. Specifically, data for elemental mercury, chemical abstract service (CAS) number 7439976, serve as the basis for the soil volatilization to indoor air criteria, groundwater volatilization to indoor air, and soil inhalation criteria. Data for methyl mercury, CAS number 22967926, serve as the basis for the GSI criterion; and data for mercuric chloride, CAS number 7487947, serve as the basis for the drinking water, groundwater contact, soil direct contact, and the groundwater protection criteria. Comparison to criteria shall be based on species-specific analytical data only if sufficient facility characterization has been conducted to rule out the presence of other species of mercury.

MSSL Footnotes:

GW = The calculated value for a hazardous substance based upon shallow groundwater is considered protective when it is greater than the calculated value for groundwater.

J = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations must be added together for comparison to screening level.

JT = Hazardous substance may be present in several isomer forms. Screening levels may be used for the individual isomer provided that it is the sole isomer detected; however, when multiple isomers are detected in a medium, the isomer-specific concentrations must be added together and compared to the most restrictive screening level of the detected isomers.

Laboratory Footnotes:

U = Analyte analyzed for but not detected above the reported sample reporting limit.

## 6. DETAILED FINDINGS – AREA B

This Section summarizes the results and the subsequent findings for Area B within QMCP derived from implementation of the SAP. The narrative follows the systematic investigative approach outlined in **Section 3**, while providing specific details about the potential human health and ecological risks associated with the historical mining operations in this subarea of QMCP.

### 6.1 SITE INSPECTION AND INVESTIGATION RESULTS

The implementation of the site inspection and investigation activities provided critical lines of evidence that link the historical documentation and the current environmental conditions in and around the Portage Canal. The following subsections present the findings of the inspection and investigation activities and provide correlation of mining era operations and their potential impacts on the nearshore and offshore environment of the Portage Canal.

#### 6.1.1 Site Inspection

The site inspection at each subarea included the inventory and locating of historical structures and similar surficial artifacts associated with the former industrial operations in the area. Each subarea was also inspected for potential physical and health hazards that were documented, photographed, and located with a GPS unit. The inventoried hazards were then qualitatively assessed for potential human health and environmental risks to determine if analytical sampling was warranted during the targeted inspection phase of the work.

On September 13, 2018, MSG field team personnel performed reconnaissance activities at Area B. In the cases where access was not requested based on historic operational and investigative findings, property conditions were evaluated from a neighboring property or public right of way where access was permitted. Access to Area B was not requested based on historic operational and investigative findings.

Therefore, the property parcel known as the Houghton County Road Commission totaling approximately 10 acres was visually inspected and observations were recorded from the MDNR trail property. The qualitative assessment of the reconnaissance findings in Area B warranted the performance of targeted inspection activities.

##### 6.1.1.1 Reconnaissance

The reconnaissance activities identified one area of potentially oil stained soil that was observed originating from a hole to the north of the MDNR trail property, crossing the trail, and extending down to the edge of the Portage Canal. In addition, a suspect UST was observed along the shoreline. A copy of the reconnaissance log is provided in **Appendix C, Site Inspections – Reconnaissance Logs, Targeted Inspections & Physical Hazards Inventory**.

#### 6.1.2 Site Investigation

The SI in the QMCP was developed based on a variety of data and information as outlined in **Section 3**. In addition to the historical accounts and documentation, current land use and potential exposure pathways were also taken into consideration when selecting the sampling locations specific to Area B. The following subsections present the outcomes of investigative activities completed in Area B by summarizing the laboratory analytical results and characterizing their impacts on the environmental media in which they were detected.

##### 6.1.2.1 Terrestrial Investigation

Intrusive investigation activities in Area B were generally guided by the findings of historical research and field observations. From a historical standpoint, the area was the location of operations subject to or associated with historic

mining practices such as Lake Superior Iron Works and Portage Lake Foundry & Machinery Co., but has also been the location of a Filling Station, residential dwellings, and is currently the location of the Houghton County Road Commission.

Inorganic COCs in the study area were generally understood; however, previous investigative activities did not fully characterize or address organic contaminants in soil and groundwater. The following subsections present a summary of the field observations and analytical results derived from the terrestrial sampling activities.

#### 6.1.2.1.1 Field Observations – Soil and Groundwater

Borings within the MDNR trail property were advanced by GSS to 7 ft bgs. Boring locations are depicted on **Figure 6-1, Soil Analytical Results (Area B)**. Soil observations documented on field logs indicate that the subsurface in the southern portion of Area B on the MDNR trail property is generally comprised of fine to medium brown sand.

During groundwater sampling, temporary well points were established from 3 ft to 7 ft bgs. Saturated soil conditions were encountered at depths of 3 ft bgs. Groundwater quality parameters, including temperature, conductivity, DO, and pH, measured at the time of sample collection were generally considered normal.

#### 6.1.2.1.2 Soil Sampling Results

Terrestrial soil investigation activities were completed at Area B on September 11, 2018. During the mobilization a total of three soil samples were collected from three (3) boring locations. Soil boring locations are depicted on **Figure 6-1, Soil Analytical Results (Area B)**. Investigative methodologies and soil sampling techniques were conducted using the procedures outlined in **Section 3**.

Soil sampling included collection of three (3) samples from 0 to 3 ft in depth. The samples were analyzed for the parameters identified on **Table 3-1, Sampling and Analysis Summary** of this SI Report. The selection of analytical parameters was generally based upon potential environmental impacts associated with mining era operations in the vicinity of the sampling location or field observations.

The shallow subsurface soil analytical results for Area B contained several COCs at concentrations at or above applicable regulatory criteria. Additionally, historic soil analytical results for surface and subsurface samples indicated the presence of COCs at concentrations above applicable regulatory criteria.

A detailed summary of soil analytical results collected from Area B is provided in **Table 6-1, Summary of Soil Analytical Results (Area B)**. Soil boring logs are included in **Appendix E, Boring Logs** of this SI Report.

#### 6.1.2.1.3 Groundwater Sampling Results

During the advancement of soil borings in Area B, three (3) temporary groundwater sampling locations were established to characterize groundwater in the area. The temporary sampling points were installed and sampled using the methodologies presented in **Section 3**. The screened intervals in the groundwater sampling locations were established from 3 ft to 7 ft bgs. In addition, GSS sampled five existing monitoring wells (MW-301, MW-302, MW-501, MW-503, and MW-505) between September 6 and 7, 2018 and again on September 23, 2020.

A total of 15 groundwater samples inclusive of two duplicate sample were collected. Temporary groundwater and existing monitoring well sampling locations are depicted on **Figure 6-2, Groundwater Analytical Results (Area B)**. Collected groundwater samples were analyzed for the parameters identified on **Table 3-1, Sampling and Analysis Summary** of this SI Report. The selection of analytical parameters was generally based upon potential environmental impacts associated with mining era operations in the vicinity of the sampling location or field observations. A few COCs,

predominantly SVOCs, were detected in the sample collected from temporary monitoring well QMCP-GW67 at concentrations above applicable regulatory criteria. PCBs were not detected in groundwater at Area B nor were any other COCs detected in groundwater during recent sampling above applicable criteria with the exception of metals, which were not evaluated further as discussed in **Section 4.2.5**.

A detailed summary of groundwater analytical results from Area B is provided in **Table 6-2, Summary of Groundwater Analytical Results (Area B)**. Groundwater analytical results are depicted on **Figure 6-2, Groundwater Analytical Results (Area B)**. Soil boring logs are included in **Appendix E, Boring Logs** of this SI Report.

## **6.2 NATURE AND EXTENT OF CONTAMINATION**

Utilizing the established regulatory criteria presented in **Section 4** for various land use categories and exposure pathways, the laboratory analytical results summarized in the preceding section for Area B were reviewed and compared to EGLE Cleanup Criteria Requirements for Response Activity as applicable for the sampled environmental media.

### **6.2.1 Comprehensive Exposure Assessment**

The comparison was completed to determine which ecological and human exposure pathways, risks, and conditions are relevant in Area B. Although not inclusive of relevant pathways where regulatory criteria were not exceeded, the following exposure pathways were determined to be relevant in Area B:

- Risks posed by hazardous substances in soil that may result in the volatilization of contaminants to indoor air in residential settings.
- Risks posed by hazardous substances in soil and the potential for the substances to leach to groundwater that could be used as a drinking water source in both residential and nonresidential settings.
- Risks posed by hazardous substances in soil and the potential for the substances to leach to groundwater that could vent to surface water.
- Risks posed by hazardous substances in soil and the potential for direct contact with these soils in both residential and nonresidential settings.
- Risks posed by hazardous substances in groundwater and the potential for that groundwater to be used as a drinking water source in both residential and nonresidential settings.
- Risks posed by hazardous substances in groundwater and the potential for that groundwater to vent to surface water.
- Risks posed by hazardous substances in groundwater that may result in the volatilization of contaminants to indoor air in both residential and nonresidential settings.
- Risks posed by hazardous substances in groundwater that may result in free-phase liquids.

As discussed in **Section 4.2.5**, the EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals were excluded from the soil and groundwater evaluation. The rationale for this exclusion is twofold:

- The Project investigation and anticipated response actions are being undertaken pursuant to Part 201 of NREPA, being PA 451 of 1994, as amended. The concentrations of metals in excess of the EGLE drinking water and groundwater/surface water pathway criteria are ubiquitous in the study area and are predominantly the result of the presence of stamp sands. Stamp sands are not defined as a hazardous substance nor are subject to regulation under Part 201 unless the property otherwise contains hazardous substances in excess of concentrations that satisfy the cleanup criteria for unrestricted residential use; and,
- The study area is part of OU 2 for which the EPA ROD remedy called for No Action. The EPA's ROD OU 2 includes groundwater, surface water, submerged tailings and sediments in Torch Lake, Portage Lake, the Portage Canal, and other area water bodies. Note that EPA's No Action determination relies on the following to mitigate the effects of stamp sand to the extent practicable:
  - The reduction of stamp sand loading to surface water bodies expected as a result of the remedial action taken at OU 1 and OU 3.
  - Ongoing natural sedimentation and detoxification.
  - Institutional programs and practices controlling potential future exposure to site-affected drinking water which were intended to be administered at the county and state level.
  - The long-term monitoring and the five-year review process monitoring requirements of the remedy selected for OU 1 and OU 3 under the 1992 ROD.

Note that metals criteria for other relevant pathways, and cyanide and organic contaminants for all pathways were included in the evaluation.

Furthermore, as discussed in **Section 4.2.5**, EGLE's MSSSLs were not included in the exposure pathway assessment due to unknown anticipated future land use and conditions. The MSSSLs were considered for screening and delineation purposes only.

#### 6.2.1.1 *Soil Exposure Pathway Assessment*

Soil analytical results from the Area B SI identified COC concentrations in soil that were at or above concentrations that trigger a "Facility" designation as defined in Section 20101(1)(s) of the NREPA. The following tables provide an aggregate summary of the soil sample locations with respect to the total number of samples and how they compare to the applicable EGLE Cleanup Criteria for Response Activity under both Residential and Nonresidential exposure scenarios. The tables are based solely on the total number of samples, inclusive of historical samples, collected from Area B. They list only the number of samples for a specific analytical suite that contained one or more exceedances of a given criterion.

| Soil Analytical Result Summary Table                                 | Cleanup Criteria Requirements for Response Activity – Residential** |                    |                    |                                                                                                                                                                                                          |                                                         |                                                       |                                                          |                                          |                                          |                                      |                         |                                                |
|----------------------------------------------------------------------|---------------------------------------------------------------------|--------------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|-------------------------------------------------------|----------------------------------------------------------|------------------------------------------|------------------------------------------|--------------------------------------|-------------------------|------------------------------------------------|

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the soil evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSLS or non-applicable criteria (DWPC and GSIPC for metals).

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the soil evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSLS or non-applicable criteria (DWPC and GSIPC for metals).

#### 6.2.1.2 Groundwater Exposure Pathway Assessment

Groundwater analytical results from Area B identified COC concentrations in groundwater that were at or above concentrations that trigger a “Facility” designation as defined in Section 20101(1)(s) of the NREPA. Similar to the preceding soil tables, the following table provides a summary of the aforementioned groundwater sample locations with respect to the total number of samples and how they compare to the applicable EGLE Cleanup Criteria for Response Activity under both Residential and Nonresidential exposure scenarios.

| Groundwater Analytical Result Summary Table                          | Analytical Summary      |                                    |                    | Cleanup Criteria Requirements for Response Activity – Residential and Nonresidential**                                                                                                                                                                                 |                                        |                                              |                                                                          |                                                                             |                  |                                               |

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the groundwater evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSLS or non-applicable criteria (DWC and GSIC for metals).

## 6.2.2 Extent of Contamination

The comparison of analytical results to applicable regulatory criteria indicates that potential human health and ecological risks are present in soil and groundwater in Area B. Recalling the goals and objectives of the SI, the following subsections describe the extent of contamination in environmental media in the study area.

### 6.2.2.1 Soil Extent of Contamination

Historic soil analytical results exceeded GSIPC, DWPC, DCC, residential VIAC, and/or soil MSSLS in residential and nonresidential exposure scenarios at multiple sample locations. The predominant contaminants were SVOCs, VOCs, and some inorganic compounds, including cyanide and chloride. Recent SI investigative samples collected from the MDNR trail property detected SVOCs and/or VOCs above GSIPC and/or soil MSSLS for residential and nonresidential exposure scenarios.

Most historic samples were collected from surface and subsurface soil intervals from areas that are generally inaccessible to the public inside the current perimeter fence at the Houghton County Road Commission. Recent SI samples were collected from intervals in areas that are routinely accessible to the general public along the MDNR trail property. The sampling locations were generally within approximately 200 ft of the shoreline of Portage Canal.

Soils with elevated levels of inorganic COCs are ubiquitous in the area, which becomes a limiting factor when evaluating potential exposure pathways. In the case of Area B, elevated concentrations of inorganic and organic contaminants potentially include exposure risks related to inhalation pathways and direct contact in residential and nonresidential scenarios, which must be a consideration when evaluating land use, property accessibility, and the extent of contamination in surface and near surface soils that could be encountered through normal use of the property.

The remaining exposure risks are generally related to the leaching of contaminants to groundwater and their potential impacts on drinking water (if used as a drinking water source) and surface water. These risks pose a long-term threat to the overall environmental health of the watershed. The widespread distribution of inorganic COCs throughout the region limits determinations related to the extent of contamination in Area B. Nevertheless, risks posed to groundwater and surface water are relevant and are a factor when evaluating the extent of soil contamination in the QMCP.

#### 6.2.2.2 *Groundwater Extent of Contamination*

Groundwater analytical results exceeded DWC for both residential and nonresidential exposure scenarios, and GSIC for organic contaminants throughout the western portion of Area B. SVOCs exceeded groundwater VIAC at SB-101 and MW-101 for both residential and nonresidential exposure scenarios, and MSSLs for residential and/or nonresidential scenarios at multiple locations. Water solubility criteria was exceeded at four historic locations (SB-101, MW-101, MW-108, and MW-109) and one recent location (GW-67), indicating the potential for LNAPL which has not been identified or defined. Analytical results from one SI sample location, located on MDNR trail property, exceeded GSIC, DWC for both residential and nonresidential scenarios, and water solubility criteria. The remaining SI groundwater sample locations along the trail did not exceed criteria, suggesting that the groundwater impact historically detected further inland in Area B is not migrating to the Portage Canal except potentially in the vicinity of GW-67. However, MW-502 which is presumably downgradient from MW-101 along the MDNR trail property, was filled with sediment and was not able to be sampled as part of the SI activities.

Groundwater sample intervals and monitoring well depths for historic locations were generally not available for review during evaluation; however, near-shore sample locations are assumed to generally have a shallow water table. SI groundwater sample locations were collected from temporary wells at depths ranging from 3 to 7 ft bgs.

The potential risks associated with groundwater as a drinking water source as well as its connectivity to nearby surface water bodies should be a consideration in determinations related to the extent of contamination in Area B.

### 6.3 **CONCLUSIONS AND RECOMMENDATIONS**

The analytical results and interpretation summarized in the preceding subsections document potential human health and ecological risks that are present in Area B. The following subsections provide a synopsis of these findings and a recommended path forward for addressing these risks in Area B.

#### 6.3.1 **Conclusions**

Environmental impacts in Area B are generally characterized by detections of organic and inorganic contaminants in soil and groundwater. Although specific sources of these contaminants may not be fully understood, historical research related to the operations provided substantive evidence for assessing specific operational areas and selecting target analytes anticipated to be present within the study area.

The analytical results summarized above provide sufficient analytical data and lines of evidence to conclude that the study area is a “Facility” as defined in Section 20101(1)(s) of the NREPA. The following table provides a summary of the affected environmental media, applicable regulatory criteria, and potential receptors within Area B.

| Area B – Media, Criteria, Potential Receptor Summary                 |                           |                                     |                |                                                                                                                                                                                                                                                                                                                                              |                                     |                              |                |                        |            |               |              |                                                        |                              |               |              |

In addition to the evaluation of analytical results from Area B, the following provides a summary of findings derived from the assessment of Area B with respect to the goals and objectives for the Project:

- Terrestrial sources of contamination are present in the form of inorganic COCs, cyanide, VOCs, SVOCs, and chloride in the study area. Due the historic nature of most of the analytical data, the extent of contamination in Area B has not been fully defined or addressed.
- The source of the observed oil stained soil adjacent to the MDNR trail property has not been identified.
- Soil impacts on the MDNR trail property exceeded GSIPC and soil MSSLS for residential and nonresidential scenarios but did not exceed PSIC or DCC.
- Water solubility criteria was exceeded at four historic locations (SB-101, MW-101, MW-108, and MW-109) and one recent location (GW-67), indicating the potential for LNAPL which has not been identified or defined.

### 6.3.2 Recommendations

The conclusions outlined in the preceding subsection establish that Area B is a Part 201 Facility. Section 20107a of Part 201 of NREPA describes the duties of owners or operators of a Facility, regardless of their liability, including: prevent unacceptable exposures, prevent exacerbation, and take reasonable precautions against the foreseeable actions of third parties. Some exceptions may apply; in any case, owners and operators of contaminated properties should become familiar with Section 20107a and the associated Rules.

Note: Analytical and Criteria Footnotes are included on the last page of the table.

TABLE 6-1  
Summary of Soil Analytical Results  
Area B  
Quincy Mining Company Portage Operations Area  
Abandoned Mining Wastes - Torch Lake Non-Superfund Site

Soil Table Footnotes:

- EGLE Part 201 residential and non-residential generic cleanup criteria and screening levels criteria were originally promulgated December 21, 2002 within the Administrative Rules for Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. This table reflects revisions to the criteria pursuant to the December 2010 Part 201 amendments and new criteria consistent with the provisions of R299.5706a. Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. Release Date: December 30, 2013. Updated June 2018.

- Only detected analytes are listed - Gray rows indicate requested analyses. If no analytes are listed below a gray row then all analytes of that group were either not analyzed or not detected.

- **Bold** values are concentrations detected above the laboratory reporting limit.

- **Bold/Shaded** cells indicate analyte concentration exceeded applicable criteria. EGLE Part 201 criteria exceeded is indicated by the footnote in [brackets] following the result value and defined below:

- |                                                                                |                                                                                    |

Evaluation based on EGLE Criteria at time of Project completion.

Samples described in this evaluation may actually refer to stamp sands or to other mining waste from the historic mining and reclamation processes conducted in the area.

Criteria Footnotes:

ID = Insufficient data to develop criterion.

NA = A criterion or value is not available

NLL = Hazardous substance is not likely to leach under most soil conditions.

(B) = Background, as defined in R 299.1(b), may be substituted if higher than the calculated cleanup criterion. Background levels may be less than criteria for some inorganic compounds.

(BB) = The state drinking water standard for asbestos (fibers greater than 10 micrometers in length) is in units of a million fibers per liter of water (MFL). Soil concentrations of asbestos are determined by polarized light microscop.

(C) = The criterion developed under R 299.20 to R 299.26 exceeds the chemical- specific soil saturation screening level (Csat). The person proposing or implementing response activity shall document whether additional response activity is required to control free-phase liquids or NAPL to protect against risks associated with free-phase liquids by using methods appropriate for the free-phase liquids present. Development of a site-specific Csat or methods presented in R 299.22, R 299.24(5), and R 299.26(8) may be conducted for the relevant exposure pathways.

(D) = Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).

(DD) = Hazardous substance causes developmental effects. Residential direct contact criteria are protective of both prenatal and postnatal exposure. Nonresidential direct contact criteria are protective for a pregnant adult receptor.

(F) = Criterion is based on adverse impacts to plant life and phytotoxicity.

(G) = Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. Where water hardness exceeds 400 mg Ca<sub>4</sub>/L, use 400 mg CaCO<sub>3</sub>/L for the FCV calculation. The FCV formula provides values in units of ug/L or ppb.

The generic GSI criterion is the lesser of the calculated FCV, the wildlife value (WV), and the surface water human non-drinking water value (HNDV). The soil GSI protection criteria for these hazardous substances are the greater of the 20 times the GSI criterion or the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote. A spreadsheet that may be used to calculate GSI and GSI protection criteria for (G)-footnoted hazardous substances is available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. A hardness value of 47.5 CaC<sub>4</sub>L and pH of 7, derived from the Michigan Department of Environmental Quality Draft Site Inspection Report for Lake Linden Operations dated 3/29/13, was used in the footnote G calculation spreadsheet.

(H) = Valence-specific chromium data (Cr III and Cr VI) shall be compared to the corresponding valence-specific cleanup criteria. If both Cr III and Cr VI are present in groundwater, the total concentration of both cannot exceed the drinking water criterion of 100 ug/L. If analytical data are provided for total chromium only, they shall be compared to the cleanup criteria for Cr VI. Cr III soil cleanup criterion for protection of drinking water can only be used at sites where groundwater is prevented from being used as a public water supply, currently and in the future, through an approved land or resource use restriction.

(I) = Hazardous substance may exhibit the characteristic of ignitability as defined in 40 C.F.R. §261.21 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, Remediation and Redevelopment Division (RRD), 525 West Allegan Street, Lansing, Michigan 48933, at cost.

(J) = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations shall be added together for comparison to criteria.

(M) = Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.

(P) = Amenable cyanide methods or method OIA-1677 shall be used to quantify cyanide concentrations for compliance with all groundwater criteria. Total cyanide methods or method OIA-1677 shall be used to quantify cyanide concentrations for compliance with soil criteria. Nonresidential direct contact criteria may not be protective of the potential for release of hydrogen cyanide gas. Additional land or resource use restrictions may be necessary to protect for the acute inhalation concerns associated with hydrogen cyanide gas.

(Q) = Criteria for carcinogenic polycyclic aromatic hydrocarbons were developed using relative potential potencies to benzo(a)pyrene.

(R) = Hazardous substance may exhibit the characteristic of reactivity as defined in 40 C.F.R. §261.23 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost.

(T) = Refer to the federal Toxic Substances Control Act (TSCA), 40 C.F.R. §761, Subpart D and 40 C.F.R. §761, Subpart G, to determine the applicability of TSCA cleanup standards. Subpart D and Subpart G of 40 C.F.R. §761 (July 1, 2001) are adopted by reference in these rules and are available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulations may be purchased, at a cost as of the time of adoption of these rules of \$55, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401, or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost. Alternatives to compliance with the TSCA standards listed below are possible under 40 C.F.R. §761 Subpart D. New releases may be subject to the standards identified in 40 C.F.R. §761, Subpart G. Use Part 201 soil direct contact cleanup criteria in the published table if TSCA standards are not applicable.

(X) = The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information.)

(Z) = Mercury is typically measured as total mercury. The generic cleanup criteria, however, are based on data for different species of mercury. Specifically, data for elemental mercury, chemical abstract service (CAS) number 7439976, serve as the basis for the soil volatilization to indoor air criteria, groundwater volatilization to indoor air, and soil inhalation criteria. Data for methyl mercury, CAS number 22967926, serve as the basis for the GSI criterion; and data for mercuric chloride, CAS number 7487947, serve as the basis for the drinking water, groundwater contact, soil direct contact, and the groundwater protection criteria. Comparison to criteria shall be based on species-specific analytical data only if sufficient facility characterization has been conducted to rule out the presence of other species of mercury.

MSSL Footnotes:

J = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations must be added together for comparison to screening level.

JT = Hazardous substance may be present in several isomer forms. Screening levels may be used for the individual isomer provided that it is the sole isomer detected; however, when multiple isomers are detected in a medium, the isomer-specific concentrations must be added together and compared to the most restrictive screening level of the detected isomers.

M = The screening level may be below target detection limits (TDL).

Laboratory Footnotes:

J = The result is an estimated quantity.

U = Analyte analyzed for but not detected above the reported sample reporting limit.

UU = Analyte analyzed for but not detected above the reported sample reporting limit and is an estimated quantity.
