- EGLE Part 201 residential and non-residential generic cleanup criteria and screening levels criteria were originally promulgated December 21, 2002 within the Administrative Rules for Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. This table reflects revisions to the criteria pursuant to the December 2010 Part 201 amendments and new criteria consistent with the provisions of R299.5706a. Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. Release Date: December 30, 2013. Updated December 21, 2020.

- Only detected analytes are listed - Gray rows indicate requested analyses. If no analytes are listed below a gray row then all analytes of that group were either not analyzed or not detected.

- **Bold** values are concentrations detected above the laboratory reporting limit.

- **Bold/Shaded** cells indicate analyte concentration exceeded applicable criteria. EGLE Part 201 criteria exceeded is indicated by the footnote in [brackets] following the result value and defined below:

|                                                                                   |                                                    |
|-----------------------------------------------------------------------------------|----------------------------------------------------|

| ug/l = Micrograms per liter           |                                                                                                     |

Groundwater Table Footnotes:

ID = Insufficient data to develop criterion.

NA = A criterion or value is not available

NLV = Hazardous substance is not likely to volatilize under most conditions.

(A) = Criterion is the state of Michigan drinking water standard established pursuant to Section 5 of 1976 PA 399, MCL 325.1005.

(AA) = Use 10,000 ug/l where groundwater enters a structure through the use of a water well, sump or other device. Use 28,000 ug/l for all other uses.

(B) = Background, as defined in R 299.1(b), may be substituted if higher than the calculated cleanup criterion. Background levels may be less than criteria for some inorganic compounds.

(D) = Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).

(E) = Criterion is the aesthetic drinking water value, as required by Section 20120a(5) of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (NREPA). A notice of aesthetic impact may be employed as an institutional control mechanism if groundwater concentrations exceed the aesthetic drinking water criterion, but do not exceed the applicable health-based drinking water value provided in a table available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information)

(FF) = The chloride GSI criterion shall be 125 mg/l when the discharge is to surface waters of the state designated as public water supply sources or 50 mg/l when the discharge is to the Great Lakes or connecting waters. Chloride GSI criteria shall not apply for surface waters of the state that are not designated as a public water supply source, however, the total dissolved solids criterion is applicable.

(G) = Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. Where water hardness exceeds 400 mg CaCO<sub>3</sub>/L, use 400 mg CaCO<sub>3</sub>/L for the FCV calculation. The FCV formula provides values in units of ug/L or ppb. The generic GSI criterion is the lesser of the calculated FCV, the wildlife value (WV), and the surface water human non-drinking water value (HNDV). The soil GSI protection criteria for these hazardous substances are the greater of the 20 times the GSI criterion or the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote. A spreadsheet that may be used to calculate GSI and GSI protection criteria for (G)-footnoted hazardous substances is available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. A hardness value of 47.5 CaCO<sub>3</sub>/L and pH of 7, derived from the Michigan Department of Environmental Quality Draft Site Inspection Report for Lake Linden Operations dated 3/29/13, was used in the footnote G calculation spreadsheet.

(H) = Valence-specific chromium data (Cr III and Cr VI) shall be compared to the corresponding valence-specific cleanup criteria. If both Cr III and Cr VI are present in groundwater, the total concentration of both cannot exceed the drinking water criterion of 100 ug/L. If analytical data are provided for total chromium only, they shall be compared to the cleanup criteria for Cr VI. Cr III soil cleanup criterion for protection of drinking water can only be used at sites where groundwater is prevented from being used as a public water supply, currently and in the future, through an approved land or resource use restriction.

(HH) = The residential criterion for sodium is 230,000 ug/l in accordance with the Sodium Advisory Council recommendation and revised Groundwater Discharge Standards.

(I) = Hazardous substance may exhibit the characteristic of ignitability as defined in 40 C.F.R. §261.21 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, Remediation and Redevelopment Division (RRD), 525 West Allegan Street, Lansing, Michigan 48933, at cost.

(J) = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations shall be added together for comparison to criteria.

(L) = Criteria for lead are derived using a biologically based model, as allowed for under Section 20120a(9) of the NREPA, and are not calculated using the algorithms and assumptions specified in pathway-specific rules. The generic residential drinking water criterion of 4 ug/L is linked to the generic residential soil direct contact criterion of 400 mg/kg. A higher concentration in the drinking water, up to the state action level of 15 ug/L, may be allowed as a site-specific remedy and still allow for drinking water use, under Section 20120a(2) and 20120b of the NREPA if soil concentrations are appropriately lower than 400 mg/kg. If a site-specific criterion is approved based on this subdivision, a notice shall be filed on the deed for all property where the groundwater concentrations will exceed 4 ug/L to provide notice of the potential for unacceptable risk if soil or groundwater concentrations increase.

Acceptable combinations of site-specific soil and drinking water concentrations are presented in a table available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site (See R 299.49 Footnotes for generic cleanup criteria tables for additional information).

(M) = Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.

(Q) = Criteria for carcinogenic polycyclic aromatic hydrocarbons were developed using relative potential potencies to benzo(a)pyrene.

(S) = Criterion defaults to the hazardous substance-specific water solubility limit.

(T) = Refer to the federal Toxic Substances Control Act (TSCA), 40 C.F.R. §761, Subpart D and 40 C.F.R. §761, Subpart G, to determine the applicability of TSCA cleanup standards. Subpart D and Subpart G of 40 C.F.R. §761 (July 1, 2001) are adopted by reference in these rules and are available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulations may be purchased, at a cost as of the time of adoption of these rules of \$55, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401, or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost. Alternatives to compliance with the TSCA standards listed below are possible under 40 C.F.R. §761 Subpart D. New releases may be subject to the standards identified in 40 C.F.R. §761, Subpart G. Use Part 201 soil direct contact cleanup criteria in the published table if TSCA standards are not applicable.

(X) = The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information.)

(Z) = Mercury is typically measured as total mercury. The generic cleanup criteria, however, are based on data for different species of mercury. Specifically, data for elemental mercury, chemical abstract service (CAS) number 7439976, serve as the basis for the soil volatilization to indoor air criteria, groundwater volatilization to indoor air, and soil inhalation criteria. Data for methyl mercury, CAS number 22967926, serve as the basis for the GSI criterion; and data for mercuric chloride, CAS number 7487947, serve as the basis for the drinking water, groundwater contact, soil direct contact, and the groundwater protection criteria. Comparison to criteria shall be based on species-specific analytical data only if sufficient facility characterization has been conducted to rule out the presence of other species of mercury.

MSSL Footnotes:

GW = The calculated value for a hazardous substance based upon shallow groundwater is considered protective when it is greater than the calculated value for groundwater.

J = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations must be added together for comparison to screening level.

JT = Hazardous substance may be present in several isomer forms. Screening levels may be used for the individual isomer provided that it is the sole isomer detected; however, when multiple isomers are detected in a medium, the isomer-specific concentrations must be added together and compared to the most restrictive screening level of the detected isomers.

Laboratory Footnotes:

U = Analyte analyzed for but not detected above the reported sample reporting limit.

## 7. DETAILED FINDINGS – AREA E

This Section summarizes the SI results and the subsequent findings for Area E within QMCP derived from implementation of the SAP. The narrative follows the systematic investigative approach outlined in **Section 3**, while providing specific details about the potential human health and ecological risks associated with the historical mining operations in this subarea of QMCP.

### 7.1 SITE INSPECTION AND INVESTIGATION RESULTS

The implementation of the site inspection and investigation activities provided critical lines of evidence that link the historical documentation and the current environmental conditions in and around the Portage Canal. The following subsections present the findings of the inspection and investigation activities and provide correlation, if possible, of mining era operations and their potential impacts on the nearshore and offshore environment of the Portage Canal.

#### 7.1.1 Site Inspection

The site inspection at each subarea included the inventory and locating of historical structures and similar surficial artifacts associated with the former industrial operations in the area. Each subarea was also inspected for potential physical and health hazards that were documented, photographed, and located with a GPS unit. The inventoried hazards were then qualitatively assessed for potential human health and environmental risks to determine if analytical sampling was warranted during the targeted inspection phase of the work.

On September 25, 2018, MSG field team personnel performed reconnaissance activities at Area E. In the cases where access was not requested based on historic operational and investigative findings, property conditions were evaluated from a neighboring property or public right of way where access was permitted.

Therefore, the property parcel known as Area E totaling approximately five acres was visually inspected and observations were recorded from the MDNR trail property. The qualitative assessment of the reconnaissance findings in Area E did not warrant the performance of targeted inspection activities. The following provides a summary of the findings associated with the reconnaissance activities. A copy of the reconnaissance log is provided in **Appendix C, Site Inspections – Reconnaissance Logs, Targeted Inspections & Physical Hazards Inventory**.

##### 7.1.1.1 Reconnaissance

The reconnaissance activities identified darkened stained soil near a residential burn barrel and evidence of rusted metal debris that appeared to be residential in nature that was unearthed by flooding. Potentially abandoned containers or other environmental concerns were not observed during the review of Area E.

#### 7.1.2 Site Investigation

The SI in the QMCP was developed based on a variety of data and information as outlined in **Section 3**. In addition to the historical accounts and documentation, current land use and potential exposure pathways were also taken into consideration when selecting the sampling locations specific to Area E. The following subsections present the outcomes of investigative activities completed in Area E by summarizing the laboratory analytical results and characterizing their impacts on the environmental media in which they were detected.

##### 7.1.2.1 Terrestrial Investigation

Intrusive investigation activities in Area E were generally guided by the findings of historical research, and field observations of potentially impacted soils on MDNR property from an MDNR Surveyor. From a historical standpoint,

the area was adjacent to the location of operations subject to or associated with historic mining practices; however, other historic land used and/or operations are unknown.

COCs in the study area were not generally understood nor previously investigated to fully characterize or address potential organic and inorganic contaminants in soil and groundwater. The following subsections present a summary of the field observations and analytical results derived from the terrestrial sampling activities.

#### 7.1.2.1.1 Field Observations – Soil and Groundwater

Borings within the MDNR trail property were advanced by GSS to 8 or 9 feet ft bgs. Boring locations are depicted on **Figure 7-1, Soil Analytical Results (Area E)**. Soil observations documented on field logs indicate that the subsurface of Area E within the MDNR trail property is generally comprised of medium to coarse brown sand.

During groundwater sampling, temporary well points were established at 4 ft intervals ranging from 4 ft or 5 ft bgs to the bottom of the screened interval. Saturated soil conditions were encountered at a depth of approximately 4 ft bgs. Groundwater quality parameters, including temperature, conductivity, DO, and pH, measured at the time of sample collection were generally considered normal.

#### 7.1.2.1.2 Soil Sampling Results

Terrestrial soil investigation activities were completed at Area E on September 5 and 7, 2018. During the mobilization a total of seven soil samples, including one duplicate, were collected from three soil boring locations and four soil samples, including one duplicate, were collected from three surface soil sampling locations. Samples were generally collected from 0 to 6 inches (in.) and 0.5 to 4 ft bgs. Soil boring and surface soil sampling locations are depicted on **Figure 7-1, Soil Analytical Results (Area E)**. Investigative methodologies and soil sampling techniques were conducted using the procedures outlined in **Section 3**.

All soil samples were analyzed for the parameters identified on **Table 3-1, Sampling and Analysis Summary** of this SI Report. The selection of analytical parameters was generally based upon potential environmental impacts associated with mining era operations in the vicinity of the sampling location or field observations.

The shallow and subsurface soil analytical results for Area E contained one COC (naphthalene) at concentrations at or above applicable regulatory criteria and several COCs above MSSLs.

A detailed summary of soil analytical results collected from Area E is provided in **Table 7-1, Summary of Soil Analytical Results (Area E)**. Soil boring logs are included in **Appendix E, Boring Logs** of this SI Report.

#### 7.1.2.1.3 Groundwater Sampling Results

During the advancement of soil borings in Area E, three (3) temporary groundwater sampling locations were established to characterize groundwater in the area. The temporary monitoring points were installed and sampled using the methodologies presented in **Section 3**. The screened intervals in the groundwater sampling locations were established at 4 ft to 8 ft bgs or 5 ft to 9 ft bgs depending on location. Four (4) groundwater samples were collected, including one duplicate sample. Temporary groundwater sampling locations are depicted on **Figure 7-2, Groundwater Analytical Results (Area E)**.

Collected groundwater samples were analyzed for the parameters identified on **Table 3-1, Sampling and Analysis Summary** of this SI Report. The selection of analytical parameters was generally based upon potential environmental impacts associated with mining era operations in the vicinity of the sampling location or field observations. Mercury was detected in all of the groundwater samples collected from temporary sampling points in Area E at concentrations

above residential and nonresidential MSSLS but not above regulatory criteria. PCBs were not detected in groundwater at Area E nor were any other COCs detected in groundwater above applicable criteria with the exception of metals, which were not evaluated further as discussed in **Section 4.2.5**.

A detailed summary of groundwater analytical results collected from Area E is provided in **Table 7-2, Summary of Groundwater Analytical Results (Area E)**. Groundwater analytical results are depicted on **Figure 7-2, Groundwater Analytical Results (Area E)**. Soil boring logs are included in **Appendix E, Boring Logs** of this SI Report.

## 7.2 NATURE AND EXTENT OF CONTAMINATION

Utilizing the established regulatory criteria presented in **Section 4** for various land use categories and exposure pathways, the laboratory analytical results summarized in the preceding section for Area E were reviewed and compared to EGLE Cleanup Criteria Requirements for Response Activity as applicable for the sampled environmental media.

### 7.2.1 Comprehensive Exposure Assessment

The comparison was completed to determine which ecological and human exposure pathways, risks, and conditions are relevant at Area E. Although not inclusive of relevant pathways where regulatory criteria were not exceeded, the following exposure pathways were determined to be relevant in Area E:

- Risks posed by hazardous substances in soil and the potential for the substances to leach to groundwater that could vent to surface water.

As discussed in **Section 4.2.5**, EGLE drinking water and groundwater/surface water pathway criteria exceedances for metals were excluded from the soil and groundwater evaluation. The rationale for this exclusion is twofold:

- The Project investigation and anticipated response actions are being undertaken pursuant to Part 201 of NREPA, being PA 451 of 1994, as amended. The concentrations of metals in excess of EGLE drinking water and groundwater/surface water pathway criteria are ubiquitous in the study area and are predominantly the result of the presence of stamp sands. Stamp sands are not defined as a hazardous substance nor are subject to regulation under Part 201 unless the property otherwise contains hazardous substances in excess of concentrations that satisfy the cleanup criteria for unrestricted residential use; and,
- The study area is part of OU 2 for which the EPA ROD remedy called for No Action. The EPA's ROD OU 2 includes groundwater, surface water, submerged tailings and sediments in Torch Lake, Portage Lake, the Portage Canal, and other area water bodies. Note that EPA's No Action determination relies on the following to mitigate the effects of stamp sand to the extent practicable:
  - The reduction of stamp sand loading to surface water bodies expected as a result of the remedial action taken at OU 1 and OU 3.
  - Ongoing natural sedimentation and detoxification.
  - Institutional programs and practices controlling potential future exposure to site-affected drinking water which were intended to be administered at the county and state level.
  - The long-term monitoring and the five-year review process monitoring requirements of the remedy selected for OU 1 and OU 3 under the 1992 ROD.

Note that metals criteria for other relevant pathways, and cyanide and organic contaminants for all pathways were included in the evaluation.

Furthermore, as discussed in **Section 4.2.5**, EGLE's MSSLs were not included in the exposure pathway assessment due to unknown anticipated future land use and conditions. The MSSLs were considered for screening and delineation purposes only.

#### 7.2.1.1 Soil Exposure Pathway Assessment

Soil analytical results from Area E identified COC concentrations in soil that were at or above concentrations that trigger a "Facility" designation as defined in Section 20101(1)(s) of the NREPA. The following tables provide an aggregate summary of the soil sample locations with respect to the total number of samples and how they compare to the applicable EGLE Cleanup Criteria for Response Activity under both Residential and Nonresidential exposure scenarios. The tables are based solely on the total number of samples collected from Area E. They list only the number of samples for a specific analytical suite that contained one or more exceedance of a given criterion.

| Soil Analytical Result Summary Table                                 |                         |                    |                    | Cleanup Criteria Requirements for Response Activity – Residential** |                                                         |                                                       |                                                          |                                          |                                          |                                      |                         |                                                |

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the groundwater evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSLs or non-applicable criteria (DWPC and GSIPC for metals).

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the groundwater evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSLS or non-applicable criteria (DWPC and GSIPC for metals).

#### 7.2.1.2 Groundwater Exposure Pathway Assessment

Groundwater analytical results from Area E did not identify COC concentrations in groundwater that were at or above concentrations that trigger a “Facility” designation as defined in Section 20101(1)(s) of the NREPA. Similar to the preceding soil tables, the following table provides a summary of the aforementioned sample locations with respect to the total number of samples and how they compare to the applicable EGLE Cleanup Criteria for Response Activity under both Residential and Nonresidential exposure scenarios.

| Groundwater Analytical Result Summary Table                          | Analytical Summary      |                                    |                    | Cleanup Criteria Requirements for Response Activity – Residential and Nonresidential** |                                        |                                              |                                                                          |                                                                             |                  |                                               |

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the groundwater evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSLS or non-applicable criteria (DWC and GSIC for metals).

## 7.2.2 Extent of Contamination

The comparison of analytical results to applicable regulatory criteria indicates that potential human health and ecological risks are present in soil and groundwater in Area E. Recalling the goals and objectives of the SI, the following subsections describe the extent of contamination in environmental media in the study area.

### 7.2.2.1 Soil Extent of Contamination

Soil analytical results exceeded GSIPC and residential and nonresidential MSSLS within Area E. Naphthalene was detected at concentrations exceeding GSIPC near the approximate location of contaminated soil reported by an MDNR surveyor. While not exceeding regulatory criteria, mercury and certain VOCs were also detected at concentrations exceeding MSSLS.

All samples were collected from surface and subsurface soil intervals from areas that are generally accessible to the public despite being private or municipally-owned properties. The sampling locations were within approximately 100 ft to 350 ft of the shoreline of the Portage Canal and all but two were located on the publicly accessed MDNR trail property.

The extent of contaminated soils has not been fully delineated within Area E. Elevated concentrations of inorganic and organic contaminants potentially include exposure risks related to inhalation pathways, which must be a consideration when evaluating land use, property accessibility, and the extent of contamination in surface and near surface soils that could be encountered through normal use of the property.

The remaining exposure risks are generally related to the leaching of SVOCs to groundwater and their potential impacts on surface water. These risks pose a long-term threat to the overall environmental health of the watershed. The widespread distribution of inorganic COCs throughout the region limit determinations related to the extent of metals contamination in Area E. Nevertheless, risks are posed to groundwater and surface water and are a factor when evaluating the extent of soil contamination in Area E.

#### 7.2.2.2 *Groundwater Extent of Contamination*

Groundwater analytical results exceeded shallow groundwater MSSLS for residential and nonresidential exposure scenarios and the residential groundwater MSSL for mercury. The mercury concentrations did not exceed regulatory criteria.

No other analyzed constituents were detected above criteria or screening levels within Area E. The groundwater sampling locations were established in a zone roughly 100 ft to 250 ft from the shoreline of the Portage Canal at depths of approximately 4 ft to 9 ft bgs.

### 7.3 **CONCLUSIONS AND RECOMMENDATIONS**

The analytical results and interpretation summarized in the preceding subsections document potential human health and ecological risks that are present in Area E. The following subsections provide a synopsis of these findings and a recommended path forward for mitigating these risks in Area E.

#### 7.3.1 **Conclusions**

Environmental impacts in Area E are generally characterized by detections of organic and inorganic contaminants in soil and groundwater. Although specific sources of these contaminants may not be fully understood, historical research related to the operations nearby provided substantive evidence for selecting target analytes anticipated to be present within the study area and MDNR surveyor observations provided input on a specific area to assess.

The analytical results from SI activities summarized above provide analytical data and lines of evidence to conclude that the study area is a "Facility" as defined in Section 20101(1)(s) of the NREPA based on the detection of naphthalene exceeding GSIPC. The following table provides a summary of the affected environmental media, applicable regulatory criteria, and potential receptors within Area E.

| Area E – Media, Criteria, Potential Receptor Summary                 |                           |                                     |                |                           |                                     |                              |                |                        |            |               |              |                                                        |                              |               |

| Benthic Organism                                                     |                           |                                     |                |                           |                                     |                              |                |                        |            |               |              |                                                        |                              |               |
| COCs exceeding applicable regulatory criteria in one or more samples |                           |                                     |                | NAPHTHALENE (SVOC)        |                                     |                              |                |                        |            |               |              |                                                        |                              |               |

In addition to the evaluation of analytical results from Area E, the following provides a summary of findings derived from the assessment of Area E with respect to the goals and objectives for the Project:

- Terrestrial sources of contamination are present in the form of VOCs, SVOCs, and limited inorganic COCs in the study area. Due the limited availability of historic and current SI analytical data, the extent of contamination in Area E has not been fully investigated, defined, or addressed.
- Soil impacts on the MDNR trail property exceeded GSIPC and MSSSLs for residential and nonresidential scenarios but did not exceed PSIC or DCC.

### 7.3.2 Recommendations

The conclusions outlined in the preceding subsection establish that Area E is a Part 201 Facility. Section 20107a of Part 201 of NREPA describes the duties of owners or operators of a Facility, regardless of their liability, including: prevent unacceptable exposures, prevent exacerbation, and take reasonable precautions against the foreseeable actions of third parties. Some exceptions may apply; in any case, owners and operators of contaminated properties should become familiar with Section 20107a and the associated Rules.

TABLE 7-1  
Summary of Soil Analytical Results  
Area E  
Quincy Mining Company Portage Operations Area  
Abandoned Mining Wastes - Torch Lake Non-Superfund Site

Soil Table Footnotes:

- EGLE Part 201 residential and non-residential generic cleanup criteria and screening levels criteria were originally promulgated December 21, 2002 within the Administrative Rules for Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. This table reflects revisions to the criteria pursuant to the December 2010 Part 201 amendments and new criteria consistent with the provisions of R299.5706a. Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. Release Date: December 30, 2013. Updated June 2018.

- Only detected analytes are listed - Gray rows indicate requested analyses. If no analytes are listed below a gray row then all analytes of that group were either not analyzed or not detected.

- **Bold** values are concentrations detected above the laboratory reporting limit.

- **Bold/Shaded** cells indicate analyte concentration exceeded applicable criteria. EGLE Part 201 criteria exceeded is indicated by the footnote in [brackets] following the result value and defined below:

- |                                                                                |                                                                                    |

| [10] - Residential Direct Contact Criteria                                     | [19] - Soil Nonresidential MSSL                                                    |

Evaluation based on EGLE Criteria at time of Project completion.

Samples described in this evaluation may actually refer to stamp sands or to other mining waste from the historic mining and reclamation processes conducted in the area.

-- = No Exceedances

NM = Not Measured

ND = Not Detected

bgs = Below ground surface

ft = Feet

in = Inches

mg/kg = Milligrams per kilogram.

PCBs = Polychlorinated biphenyls

VOC = Volatile organic compound

SVOC = Semi-volatile organic compound

MSSL = Media-Specific Volatilization to Indoor Air Interim Action Screening Level

ug/kg = Micrograms per kilogram

% = Percentage

Criteria Footnotes:

ID = Insufficient data to develop criterion.

NA = A criterion or value is not available

NLL = Hazardous substance is not likely to leach under most soil conditions.

(B) = Background, as defined in R 299.1(b), may be substituted if higher than the calculated cleanup criterion. Background levels may be less than criteria for some inorganic compounds.

(BB) = The state drinking water standard for asbestos (fibers greater than 10 micrometers in length) is in units of a million fibers per liter of water (MFL). Soil concentrations of asbestos are determined by polarized light microscop.

(C) = The criterion developed under R 299.20 to R 299.26 exceeds the chemical- specific soil saturation screening level (Csat). The person proposing or implementing response activity shall document whether additional response activity is required to control free-phase liquids or NAPL to protect against risks associated with free-phase liquids by using methods appropriate for the free-phase liquids present. Development of a site-specific Csat or methods presented in R 299.22, R 299.24(5), and R 299.26(8) may be conducted for the relevant exposure pathways.

(D) = Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).

(DD) = Hazardous substance causes developmental effects. Residential direct contact criteria are protective of both prenatal and postnatal exposure. Nonresidential direct contact criteria are protective for a pregnant adult receptor.

(F) = Criterion is based on adverse impacts to plant life and phytotoxicity.

(G) = Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. Where water hardness exceeds 400 mg Ca/L, use 400 mg CaCO<sub>3</sub>/L for the FCV calculation. The FCV formula provides values in units of ug/L or ppb.

The generic GSI criterion is the lesser of the calculated FCV, the wildlife value (WV), and the surface water human non-drinking water value (HNDV). The soil GSI protection criteria for these hazardous substances are the greater of the 20 times the GSI criterion or the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote. A spreadsheet that may be used to calculate GSI and GSI protection criteria for (G)-footnoted hazardous substances is available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. A hardness value of 47.5 CaCO<sub>3</sub>/L and pH of 7, derived from the Michigan Department of Environmental Quality Draft Site Inspection Report for Lake Linden Operations dated 3/29/13, was used in the footnote G calculation spreadsheet.

(H) = Valence-specific chromium data (Cr III and Cr VI) shall be compared to the corresponding valence-specific cleanup criteria. If both Cr III and Cr VI are present in groundwater, the total concentration of both cannot exceed the drinking water criterion of 100 ug/L. If analytical data are provided for total chromium only, they shall be compared to the cleanup criteria for Cr VI. Cr III soil cleanup criterion for protection of drinking water can only be used at sites where groundwater is prevented from being used as a public water supply, currently and in the future, through an approved land or resource use restriction.

(I) = Hazardous substance may exhibit the characteristic of ignitability as defined in 40 C.F.R. §261.21 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, Remediation and Redevelopment Division (RRD), 525 West Allegan Street, Lansing, Michigan 48933, at cost.

(J) = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations shall be added together for comparison to criteria.

(M) = Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.

(P) = Amenable cyanide methods or method OIA-1677 shall be used to quantify cyanide concentrations for compliance with all groundwater criteria. Total cyanide methods or method OIA-1677 shall be used to quantify cyanide concentrations for compliance with soil criteria. Nonresidential direct contact criteria may not be protective of the potential for release of hydrogen cyanide gas. Additional land or resource use restrictions may be necessary to protect for the acute inhalation concerns associated with hydrogen cyanide gas.

(Q) = Criteria for carcinogenic polycyclic aromatic hydrocarbons were developed using relative potential potencies to benzo(a)pyrene.

(R) = Hazardous substance may exhibit the characteristic of reactivity as defined in 40 C.F.R. §261.23 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost.

(T) = Refer to the federal Toxic Substances Control Act (TSCA), 40 C.F.R. §761, Subpart D and 40 C.F.R. §761, Subpart G, to determine the applicability of TSCA cleanup standards. Subpart D and Subpart G of 40 C.F.R. §761 (July 1, 2001) are adopted by reference in these rules and are available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulations may be purchased, at a cost as of the time of adoption of these rules of \$55, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401, or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost. Alternatives to compliance with the TSCA standards listed below are possible under 40 C.F.R. §761 Subpart D. New releases may be subject to the standards identified in 40 C.F.R. §761, Subpart G. Use Part 201 soil direct contact cleanup criteria in the published table if TSCA standards are not applicable.

(X) = The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information.)

(Z) = Mercury is typically measured as total mercury. The generic cleanup criteria, however, are based on data for different species of mercury. Specifically, data for elemental mercury, chemical abstract service (CAS) number 7439976, serve as the basis for the soil volatilization to indoor air criteria, groundwater volatilization to indoor air, and soil inhalation criteria. Data for methyl mercury, CAS number 22967926, serve as the basis for the GSI criterion; and data for mercuric chloride, CAS number 7487947, serve as the basis for the drinking water, groundwater contact, soil direct contact, and the groundwater protection criteria. Comparison to criteria shall be based on species-specific analytical data only if sufficient facility characterization has been conducted to rule out the presence of other species of mercury.

MSSL Footnotes:

J = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations must be added together for comparison to screening level.

JT = Hazardous substance may be present in several isomer forms. Screening levels may be used for the individual isomer provided that it is the sole isomer detected; however, when multiple isomers are detected in a medium, the isomer-specific concentrations must be added together and compared to the most restrictive screening level of the detected isomers.

M = The screening level may be below target detection limits (TDL).

Laboratory Footnotes:

J = The result is an estimated quantity.

U = Analyte analyzed for but not detected above the reported sample reporting limit.

UU = Analyte analyzed for but not detected above the reported sample reporting limit and is an estimated quantity.

Note: Analytical and Criteria Footnotes are included on the last page of the table.

TABLE 7-2  
Summary of Groundwater Analytical Results  
Area E  
Quincy Mining Company Portage Operations Area  
Abandoned Mining Wastes - Torch Lake Non-Superfund Site

Groundwater Table Footnotes:

- EGLE Part 201 residential and non-residential generic cleanup criteria and screening levels criteria were originally promulgated December 21, 2002 within the Administrative Rules for Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. This table reflects revisions to the criteria pursuant to the December 2010 Part 201 amendments and new criteria consistent with the provisions of R299.5706a. Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. Release Date: December 30, 2013. Updated December 21, 2020.

- Only detected analytes are listed - Gray rows indicate requested analyses. If no analytes are listed below a gray row then all analytes of that group were either not analyzed or not detected.

- Bold values are concentrations detected above the laboratory reporting limit.

- Bold/Shaded cells indicate analyte concentration exceeded applicable criteria. EGLE Part 201 criteria exceeded is indicated by the footnote in [brackets] following the result value and defined below:

|                                                                                   |                                                    |
|-----------------------------------------------------------------------------------|----------------------------------------------------|
| [1] - Residential Drinking Water Criteria                                         | [8] Shallow Groundwater Residential MSSL           |
| [2] - Nonresidential Drinking Water Criteria                                      | [9] Shallow Groundwater Nonresidential MSSL        |
| [3] - Groundwater Surface Water Interface Criteria                                | [10] Groundwater Residential MSSL                  |
| [4] - Water Solubility                                                            | [11] Groundwater Residential TS MSSL               |
| [5] - Residential Groundwater Volatilization to Indoor Air Inhalation Criteria    | [12] Groundwater Nonresidential MSSL               |
| [6] - Nonresidential Groundwater Volatilization to Indoor Air Inhalation Criteria | [13] Groundwater Nonresidential MSSL <sub>12</sub> |
| [7] - Flammability and Explosivity Screening Level                                | [14] Groundwater Nonresidential TS MSSL            |

Evaluation based on EGLE Criteria at time of Project completion.

|                                       |                                                                                                     |

| VOC = Volatile organic compound       | TS MSSL = Time Sensitive Media-Specific Volatilization to Indoor Air Interim Action Screening Level |

ug/l = Micrograms per liter

Groundwater Table Footnotes:

ID = Insufficient data to develop criterion.

NA = A criterion or value is not available

NLV = Hazardous substance is not likely to volatilize under most conditions.

(A) = Criterion is the state of Michigan drinking water standard established pursuant to Section 5 of 1976 PA 399, MCL 325.1005.

(AA) = Use 10,000 ug/l where groundwater enters a structure through the use of a water well, sump or other device. Use 28,000 ug/l for all other uses.

(B) = Background, as defined in R 299.1(b), may be substituted if higher than the calculated cleanup criterion. Background levels may be less than criteria for some inorganic compounds.

(D) = Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).

(E) = Criterion is the aesthetic drinking water value, as required by Section 20120a(5) of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (NREPA). A notice of aesthetic impact may be employed as an institutional control mechanism if groundwater concentrations exceed the aesthetic drinking water criterion, but do not exceed the applicable health-based drinking water value provided in a table available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information)

(FF) = The chloride GSI criterion shall be 125 mg/l when the discharge is to surface waters of the state designated as public water supply sources or 50 mg/l when the discharge is to the Great Lakes or connecting waters. Chloride GSI criteria shall not apply for surface waters of the state that are not designated as a public water supply source, however, the total dissolved solids criterion is applicable.

(G) = Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. Where water hardness exceeds 400 mg CaCO<sub>3</sub>/L, use 400 mg CaCO<sub>3</sub>/L for the FCV calculation. The FCV formula provides values in units of ug/L or ppb. The generic GSI criterion is the lesser of the calculated FCV, the wildlife value (WV), and the surface water human non-drinking water value (HNDV). The soil GSI protection criteria for these hazardous substances are the greater of the 20 times the GSI criterion or the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote. A spreadsheet that may be used to calculate GSI and GSI protection criteria for (G)-footnoted hazardous substances is available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. A hardness value of 47.5 CaCO<sub>3</sub>/L and pH of 7, derived from the Michigan Department of Environmental Quality Draft Site Inspection Report for Lake Linden Operations dated 3/29/13, was used in the footnote G calculation spreadsheet.

(H) = Valence-specific chromium data (Cr III and Cr VI) shall be compared to the corresponding valence-specific cleanup criteria. If both Cr III and Cr VI are present in groundwater, the total concentration of both cannot exceed the drinking water criterion of 100 ug/L. If analytical data are provided for total chromium only, they shall be compared to the cleanup criteria for Cr VI. Cr III soil cleanup criterion for protection of drinking water can only be used at sites where groundwater is prevented from being used as a public water supply, currently and in the future, through an approved land or resource use restriction.

(HH) = The residential criterion for sodium is 230,000 ug/l in accordance with the Sodium Advisory Council recommendation and revised Groundwater Discharge Standards.

(I) = Hazardous substance may exhibit the characteristic of ignitability as defined in 40 C.F.R. §261.21 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, Remediation and Redevelopment Division (RRD), 525 West Allegan Street, Lansing, Michigan 48933, at cost.

(J) = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations shall be added together for comparison to criteria.

(L) = Criteria for lead are derived using a biologically based model, as allowed for under Section 20120a(9) of the NREPA, and are not calculated using the algorithms and assumptions specified in pathway-specific rules. The generic residential drinking water criterion of 4 ug/L is linked to the generic residential soil direct contact criterion of 400 mg/kg. A higher concentration in the drinking water, up to the state action level of 15 ug/L, may be allowed as a site-specific remedy and still allow for drinking water use, under Section 20120a(2) and 20120b of the NREPA if soil concentrations are appropriately lower than 400 mg/kg. If a site-specific criterion is approved based on this subdivision, a notice shall be filed on the deed for all property where the groundwater concentrations will exceed 4 ug/L to provide notice of the potential for unacceptable risk if soil or groundwater concentrations increase.

Acceptable combinations of site-specific soil and drinking water concentrations are presented in a table available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site (See R 299.49 Footnotes for generic cleanup criteria tables for additional information).

(M) = Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.

(Q) = Criteria for carcinogenic polycyclic aromatic hydrocarbons were developed using relative potential potencies to benzo(a)pyrene.

(S) = Criterion defaults to the hazardous substance-specific water solubility limit.

(T) = Refer to the federal Toxic Substances Control Act (TSCA), 40 C.F.R. §761, Subpart D and 40 C.F.R. §761, Subpart G, to determine the applicability of TSCA cleanup standards. Subpart D and Subpart G of 40 C.F.R. §761 (July 1, 2001) are adopted by reference in these rules and are available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulations may be purchased, at a cost as of the time of adoption of these rules of \$55, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401, or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost. Alternatives to compliance with the TSCA standards listed below are possible under 40 C.F.R. §761 Subpart D. New releases may be subject to the standards identified in 40 C.F.R. §761, Subpart G. Use Part 201 soil direct contact cleanup criteria in the published table if TSCA standards are not applicable.

(X) = The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information.)

(Z) = Mercury is typically measured as total mercury. The generic cleanup criteria, however, are based on data for different species of mercury. Specifically, data for elemental mercury, chemical abstract service (CAS) number 7439976, serve as the basis for the soil volatilization to indoor air criteria, groundwater volatilization to indoor air, and soil inhalation criteria. Data for methyl mercury, CAS number 22967926, serve as the basis for the GSI criterion; and data for mercuric chloride, CAS number 7487947, serve as the basis for the drinking water, groundwater contact, soil direct contact, and the groundwater protection criteria. Comparison to criteria shall be based on species-specific analytical data only if sufficient facility characterization has been conducted to rule out the presence of other species of mercury.

MSSL Footnotes:

GW = The calculated value for a hazardous substance based upon shallow groundwater is considered protective when it is greater than the calculated value for groundwater.

J = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations must be added together for comparison to screening level.

JT = Hazardous substance may be present in several isomer forms. Screening levels may be used for the individual isomer provided that it is the sole isomer detected; however, when multiple isomers are detected in a medium, the isomer-specific concentrations must be added together and compared to the most restrictive screening level of the detected isomers.

Laboratory Footnotes:

U = Analyte analyzed for but not detected above the reported sample reporting limit.

## 8. DETAILED FINDINGS – AREA F

This Section summarizes the SI results and the subsequent findings for Area F within QMCP derived from implementation of the SAP. The narrative follows the systematic investigative approach outlined in **Section 3**, while providing specific details about the potential human health and ecological risks associated with the historical mining operations in this subarea of QMCP.

### 8.1 SITE INSPECTION AND INVESTIGATION RESULTS

The implementation of the site inspection and investigation activities provided critical lines of evidence that link the historical documentation and the current environmental conditions in and around the Portage Canal. The following subsections present the findings of the inspection and investigation activities and provide correlation of mining era operations and their potential impacts on the nearshore and offshore environment of the Portage Canal.

#### 8.1.1 Site Inspection

The site inspection at each subarea included the inventory and locating of historical structures and similar surficial artifacts associated with the former industrial operations in the area. Each subarea was also inspected for potential physical and health hazards that were documented, photographed, and located with a GPS unit. The inventoried hazards were then qualitatively assessed for potential human health and environmental risks to determine if analytical sampling was warranted during the targeted inspection phase of the work.

On September 13, 2018, MSG field team personnel performed reconnaissance activities at Area F. In the cases where access was not requested based on historic operational and investigative findings, property conditions were evaluated from a neighboring property or public right of way where access was permitted. Access to Area F was not requested based on historic operational and investigative findings.

Therefore, the property parcel known as Area F totaling approximately 12 acres was visually inspected and observations were recorded from the MDNR trail property. The qualitative assessment of the reconnaissance findings in Area F did not warrant the performance of targeted inspection activities. The following provides a summary of the findings associated with the reconnaissance activities. A copy of the reconnaissance log is provided in **Appendix C, Site Inspections – Reconnaissance Logs, Targeted Inspections & Physical Hazards Inventory**.

##### 8.1.1.1 Reconnaissance

The reconnaissance activities identified a household thermostat and a pile of soil that had an oily odor along the MDNR trail property. Potentially abandoned containers or other environmental concerns were not observed during the review of Area F. The reconnaissance findings did not warrant the performance of targeted inspection activities other than the soil pile was sampled during the SI.

#### 8.1.2 Site Investigation

The SI in the QMCP was developed based on a variety of data and information as outlined in **Section 3**. In addition to the historical accounts and documentation, current land use and potential exposure pathways were also taken into consideration when selecting the sampling locations specific to Area F. The following subsections present the outcomes of investigative activities completed in Area F by summarizing the laboratory analytical results and characterizing their impacts on the environmental media in which they were detected.

### 8.1.2.1 Terrestrial Investigation

Intrusive investigation activities in Area F were generally guided by the findings of historical research and field observations. From a historical standpoint, the area was the location of a Manufactured Gas Plant, Ward Brass Furnace, Standard Oil Company, and a Filling Station and Bulk Oil Station. Environmental concerns in the area south of the MDNR trail property (former Manufactured Gas Plant) have previously been addressed and were not further investigated as part of the QMCP. Environmental concerns at the former Filling Station and Bulk Oil Station in the northwest corner of Area F were addressed separate from the QMCP and will be discussed in a separate SI report.

Inorganic COCs in the study area to the south of the MDNR trail property were generally understood, particularly in areas where previous investigations and remedial actions had been completed. However, only limited data related to the COCs north of the MDNR trail property was available. The following subsections present a summary of the field observations and analytical results derived from the terrestrial sampling activities along the MDNR trail property.

#### 8.1.2.1.1 Field Observations – Soil and Groundwater

One boring within the MDNR trail property was advanced by GSS to 5 ft bgs. The boring location is depicted on **Figure 8-1, Soil Analytical Results (Area F)**. Soil observations documented on field logs indicate that the subsurface on the MDNR trail property is generally comprised of medium to coarse brown sand.

During groundwater sampling, a temporary well point was established from 5 ft bgs to the boring terminus at 9 ft bgs. Saturated soil conditions were encountered at a depth of 5 ft bgs. Groundwater quality parameters, including temperature, conductivity, DO, and pH, measured at the time of sample collection were generally considered normal.

#### 8.1.2.1.2 Soil Sampling Results

Terrestrial soil investigation activities were completed at Area F on September 7, 2018. Additional surface soil samples were collected on September 28, 2018 (SS51) and September 24, 2020 (SS310 and SS311). During the mobilizations a total of five soil samples were collected from four (4) sampling locations. Soil sampling locations are depicted on **Figure 8-1, Soil Analytical Results (Area F)**. Investigative methodologies and soil sampling techniques were conducted using the procedures outlined in **Section 3**.

Soil sampling included four shallow soil sampling intervals, generally from 0 to 3 inches or 0 to 6 inches (in.) in depth. The balance of the subsurface soil samples ranged from 0.5 ft to 5 ft in depth. The samples were analyzed for the parameters identified on **Table 3-1, Sampling and Analysis Summary** of this SI Report. The selection of analytical parameters was generally based upon potential environmental impacts associated with mining era operations in the vicinity of the sampling location or field observations.

The shallow and subsurface soil analytical results for Area F contained several COCs at concentrations at or above applicable regulatory criteria and MSSLs. Additionally, historic soil analytical results for surface and subsurface samples indicated the presence of COCs at concentrations above applicable regulatory criteria and MSSLs.

A detailed summary of soil analytical results for Area F is provided in **Table 8-1, Summary of Soil Analytical Results (Area F)**. Soil boring logs are included in **Appendix E, Boring Logs** of this SI Report.

#### 8.1.2.1.3 Groundwater Sampling Results

During the advancement of soil borings at Area F, one temporary groundwater sampling location was established to characterize groundwater in the area. The temporary monitoring point was installed and sampled using the methodologies presented in **Section 3**. The screened interval in the groundwater sampling location was established at

5 ft to 9 ft bgs One groundwater sample was collected. The temporary groundwater sampling location is depicted on **Figure 8-2, Groundwater Analytical Results (Area F)**.

The collected groundwater sample was analyzed for the parameters identified on **Table 3-1, Sampling and Analysis Summary** of this SI Report. The selection of analytical parameters was generally based upon potential environmental impacts associated with mining era operations in the vicinity of the sampling location or field observations. The only COCs detected at concentrations above applicable regulatory criteria and MSSs were metals, which were not evaluated further as discussed in **Section 4.2.5**.

A detailed summary of groundwater analytical results collected from Area F are provided in **Table 8-2, Summary of Groundwater Analytical Results (Area F)**. Groundwater analytical results are depicted on **Figure 8-2, Groundwater Analytical Results (Area F)**. Soil boring logs are included in **Appendix E, Boring Logs** of this SI Report.

## 8.2 NATURE AND EXTENT OF CONTAMINATION

Utilizing the established regulatory criteria presented in **Section 4** for various land use categories and exposure pathways, the laboratory analytical results summarized in the preceding section for Area F were reviewed and compared to EGLE Cleanup Criteria Requirements for Response Activity as applicable for the sampled environmental media.

### 8.2.1 Comprehensive Exposure Assessment

The comparison was completed to determine which ecological and human exposure pathways, risks, and conditions are relevant at Area F. Although not inclusive of relevant pathways where regulatory criteria were not exceeded, the following exposure pathways were determined to be relevant in Area F:

- Risks posed by hazardous substances in soil and the potential for the substances to leach to groundwater that could vent to surface water.
- Risks posed by hazardous substances in soil and the potential for direct contact with these soils in both residential and nonresidential settings.
- Risks posed by hazardous substances in soil and the potential for the substances to leach to groundwater that could be used as a drinking water source in both residential and nonresidential settings.
- Risks posed by hazardous substances in groundwater and the potential for that groundwater to be used as a drinking water source in both residential and nonresidential settings.
- Risks posed by hazardous substances in groundwater and the potential for that groundwater to vent to surface water.

As discussed in **Section 4.2.5**, the EGLE drinking water and groundwater/surface water pathway criteria exceedances for metals were excluded from the soil and groundwater evaluation. The rationale for this exclusion is twofold:

- The Project investigation and anticipated response actions are being undertaken pursuant to Part 201 of NREPA, being PA 451 of 1994, as amended. The concentrations of metals in excess of the EGLE drinking water and groundwater/surface water pathway criteria are ubiquitous in the study area and are predominantly the result of the presence of stamp sands. Stamp sands are not defined as a hazardous substance nor are subject to regulation under Part 201 unless the property otherwise contains hazardous substances in excess of concentrations that satisfy the cleanup criteria for unrestricted residential use; and,

- The study area is part of OU 2 for which the EPA ROD remedy called for No Action. The EPA's ROD OU 2 includes groundwater, surface water, submerged tailings and sediments in Torch Lake, Portage Lake, the Portage Canal, and other area water bodies. Note that EPA's No Action determination relies on the following to mitigate the effects of stamp sand to the extent practicable:
  - The reduction of stamp sand loading to surface water bodies expected as a result of the remedial action taken at OU 1 and OU 3.
  - Ongoing natural sedimentation and detoxification.
  - Institutional programs and practices controlling potential future exposure to site-affected drinking water which were intended to be administered at the county and state level.
  - The long-term monitoring and the five-year review process monitoring requirements of the remedy selected for OU 1 and OU 3 under the 1992 ROD.

Note that metals criteria for other relevant pathways, and cyanide and organic contaminants for all pathways were included in the evaluation.

Furthermore, as discussed in **Section 4.2.5**, EGLE's MSSLS were not included in the exposure pathway assessment due to unknown anticipated future land use and conditions. The MSSLS were considered for screening and delineation purposes only.

#### *8.2.1.1 Soil Exposure Pathway Assessment*

Soil analytical results from Area F identified COC concentrations in soil that were at or above concentrations that trigger a "Facility" designation as defined in Section 20101(1)(s) of the NREPA. The following tables provide an aggregate summary of the soil sample locations with respect to the total number of samples and how they compare to the applicable EGLE Cleanup Criteria for Response Activity under both Residential and Nonresidential exposure scenarios. The tables are based solely on the total number of samples, inclusive of historical samples, collected from Area F. They list only the number of samples for a specific analytical suite that contained one or more exceedance of a given criterion.

| Soil Analytical Result Summary Table                                 | Cleanup Criteria Requirements for Response Activity – Residential** |                    |                    |                                                                                                                                                                                                                                                                                                            |                                                         |                                                       |                                                          |                                          |                                          |                                      |                         |                                                |

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the groundwater evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSLS or non-applicable criteria (DWPC and GSIPC for metals).

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the groundwater evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSLS or non-applicable criteria (DWPC and GSIPC for metals).

#### 8.2.1.2 Groundwater Exposure Pathway Assessment

Groundwater analytical results from Area F identified COC concentrations in groundwater that were at or above concentrations that trigger a “Facility” designation as defined in Section 20101(1)(s) of the NREPA. Similar to the preceding soil tables, the following table provides a summary of the aforementioned sample locations with respect to the total number of samples and how they compare to the applicable EGLE Cleanup Criteria for Response Activity under both Residential and Nonresidential exposure scenarios.

| Groundwater Analytical Result Summary Table                          | Analytical Summary      |                                    |                    | Cleanup Criteria Requirements for Response Activity – Residential and Nonresidential** |                                        |                                              |                                                                          |                                                                             |                  |                                               |

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the groundwater evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSLs or non-applicable criteria (DWC and GSIC for metals).

## 8.2.2 Extent of Contamination

The comparison of analytical results to applicable regulatory criteria indicates that potential human health and ecological risks are present in soil and groundwater in Area F. Recalling the goals and objectives of the SI, the following subsections describe the extent of contamination in environmental media in the study area.

### 8.2.2.1 Soil Extent of Contamination

Soil analytical results for historical and more recent SI soil samples exceeded GSIPC, DWPC, and DCC in residential and nonresidential exposure scenarios in Area F. Soil MSSLs for residential and nonresidential scenarios were also exceeded. All soil samples were collected from along the publically accessible MDNR trail property, with the exception of a historical sample (Mickelson-6) that was collected near the shoreline of the Portage Canal at a private residential property.

The sampling locations were within approximately 400 ft of the shoreline of the Portage Canal with the exception of the historic Mickelson-6 sample which was appears to have been collected along the shoreline. No physical hazards were noted during the reconnaissance of Area F along the MDNR trail property.

Soil sampling during the SI was limited to along the MDNR trail property, which becomes a limiting factor when evaluating potential exposure pathways. In the case of Area F, elevated concentrations of organic and inorganic contaminants potentially include exposure risks related to inhalation and dermal contact pathways, which must be a consideration when evaluating land use, property accessibility, and the extent of contamination in surface and near surface soils that could be encountered through normal use of the property.

The remaining exposure risks are related to the leaching of organic and inorganic contaminants to groundwater and their potential impacts on drinking water (if used as a drinking water source) and surface water. These risks pose a long-term threat to the overall environmental health of the watershed. The limits of organic contaminants exceeding criteria are not defined. The widespread distribution of inorganic COCs throughout the region limit determinations related to the extent of contamination in Area F. Nevertheless, risks posed to groundwater and surface water are relevant and are a factor when evaluating the extent of soil contamination in Area F.

#### 8.2.2.2 *Groundwater Extent of Contamination*

Groundwater analytical results for mercury exceeded shallow groundwater MSSLs for residential and nonresidential exposure scenarios but did not exceed regulatory criteria. Certain metals detected in groundwater exceeded EGLE drinking water and groundwater/surface water interface pathway criteria, but as discussed in **Section 4.2.5**, exceedances of metals for these criteria were excluded from the soil and groundwater evaluation.

No other analyzed constituents were detected above criteria or screening levels within Area F. The groundwater sampling location was established along the MDNR trail property in a zone approximately 300 ft to 400 ft from the shoreline of the Portage Canal at depths of approximately 4 ft to 9 ft bgs.

### 8.3 **CONCLUSIONS AND RECOMMENDATIONS**

The analytical results and interpretation summarized in the preceding subsections document potential human health and ecological risks that are present in Area F. The following subsections provide a synopsis of these findings and a recommended path forward for mitigating these risks in Area F.

#### 8.3.1 **Conclusions**

Environmental impacts in Area F are generally characterized by detections of organic and inorganic contaminants in soil and groundwater. Although specific sources of these contaminants may not be fully understood, historical research related to the operations provided substantive evidence for assessing specific operational areas and selecting target analytes anticipated to be present within the study area.

The results from SI activities summarized above provide analytical data and lines of evidence to conclude that the study area is a "Facility" as defined in Section 20101(1)(s) of the NREPA. The following table provides a summary of the affected environmental media, applicable regulatory criteria, and potential receptors within Area F.

| Area F – Media, Criteria, Potential Receptor Summary                 |                           |                                     |                |                                                                                                                                                                                                                                                                                                            |                                     |                              |                |                        |            |               |              |                                                        |                              |               |

In addition to the evaluation of analytical results evaluated from Area F, the following provides a summary of findings derived from the assessment of Area F with respect to the goals and objectives for the Project:

- Terrestrial sources of contamination are present in the form of VOCs, SVOCs, and inorganic COCs (predominantly arsenic and mercury), in the study area. Due the limited availability of historic and current SI analytical data, the extent of contamination in Area F has not been fully investigated, defined, or addressed, particularly north of the MDNR trail property.
- Soil impacts on the MDNR trail property exceeded GSIPC, DWPC, DCC, and MSSSLs for residential and nonresidential scenarios but did not exceed PSIC.

### 8.3.2 Recommendations

The conclusions outlined in the preceding subsection establish that Area F is a Part 201 Facility. Section 20107a of Part 201 of NREPA describes the duties of owners or operators of a Facility, regardless of their liability, including: prevent unacceptable exposures, prevent exacerbation, and take reasonable precautions against the foreseeable actions of third parties. Some exceptions may apply; in any case, owners and operators of contaminated properties should become familiar with Section 20107a and the associated Rules.

Note: Analytical and Criteria Footnotes are included on the last page of the table.

TABLE 8-1  
Summary of Soil Analytical Results  
Area F  
Quincy Mining Company Portage Operations Area  
Abandoned Mining Wastes - Torch Lake Non-Superfund Site

Soil Table Footnotes:

- EGLE Part 201 residential and non-residential generic cleanup criteria and screening levels criteria were originally promulgated December 21, 2002 within the Administrative Rules for Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. This table reflects revisions to the criteria pursuant to the December 2010 Part 201 amendments and new criteria consistent with the provisions of R299.5706a. Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. Release Date: December 30, 2013. Updated June 2018.

- Only detected analytes are listed - Gray rows indicate requested analyses. If no analytes are listed below a gray row then all analytes of that group were either not analyzed or not detected.

- **Bold** values are concentrations detected above the laboratory reporting limit.

- **Bold/Shaded** cells indicate analyte concentration exceeded applicable criteria. EGLE Part 201 criteria exceeded is indicated by the footnote in [brackets] following the result value and defined below:

|                                                                                |                                                                                    |

Evaluation based on EGLE Criteria at time of Project completion.

Samples described in this evaluation may actually refer to stamp sands or to other mining waste from the historic mining and reclamation processes conducted in the area.

| ft = Feet                        | ug/kg = Micrograms per kilogram                                                   |
| in = Inches                      | % = Percentage                                                                    |
| mg/kg = Milligrams per kilogram. |                                                                                   |

Criteria Footnotes:

ID = Insufficient data to develop criterion.

NA = A criterion or value is not available

NLL = Hazardous substance is not likely to leach under most soil conditions.

(B) = Background, as defined in R 299.1(b), may be substituted if higher than the calculated cleanup criterion. Background levels may be less than criteria for some inorganic compounds.

(BB) = The state drinking water standard for asbestos (fibers greater than 10 micrometers in length) is in units of a million fibers per liter of water (MFL). Soil concentrations of asbestos are determined by polarized light microscop.

(C) = The criterion developed under R 299.20 to R 299.26 exceeds the chemical- specific soil saturation screening level (Csat). The person proposing or implementing response activity shall document whether additional response activity is required to control free-phase liquids or NAPL to protect against risks associated with free-phase liquids by using methods appropriate for the free-phase liquids present. Development of a site-specific Csat or methods presented in R 299.22, R 299.24(5), and R 299.26(8) may be conducted for the relevant exposure pathways.

(D) = Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).

(DD) = Hazardous substance causes developmental effects. Residential direct contact criteria are protective of both prenatal and postnatal exposure. Nonresidential direct contact criteria are protective for a pregnant adult receptor.

(F) = Criterion is based on adverse impacts to plant life and phytotoxicity.

(G) = Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. Where water hardness exceeds 400 mg Ca/L, use 400 mg CaCO<sub>3</sub>/L for the FCV calculation. The FCV formula provides values in units of ug/L or ppb.

The generic GSI criterion is the lesser of the calculated FCV, the wildlife value (WV), and the surface water human non-drinking water value (HNDV). The soil GSI protection criteria for these hazardous substances are the greater of the 20 times the GSI criterion or the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote. A spreadsheet that may be used to calculate GSI and GSI protection criteria for (G)-footnoted hazardous substances is available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. A hardness value of 47.5 CaCO<sub>3</sub>L and pH of 7, derived from the Michigan Department of Environmental Quality Draft Site Inspection Report for Lake Linden Operations dated 3/29/13, was used in the footnote G calculation spreadsheet.

(H) = Valence-specific chromium data (Cr III and Cr VI) shall be compared to the corresponding valence-specific cleanup criteria. If both Cr III and Cr VI are present in groundwater, the total concentration of both cannot exceed the drinking water criterion of 100 ug/L. If analytical data are provided for total chromium only, they shall be compared to the cleanup criteria for Cr VI. Cr III soil cleanup criterion for protection of drinking water can only be used at sites where groundwater is prevented from being used as a public water supply, currently and in the future, through an approved land or resource use restriction.

(I) = Hazardous substance may exhibit the characteristic of ignitability as defined in 40 C.F.R. §261.21 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, Remediation and Redevelopment Division (RRD), 525 West Allegan Street, Lansing, Michigan 48933, at cost.

(J) = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations shall be added together for comparison to criteria.

(M) = Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.

(P) = Amenable cyanide methods or method OIA-1677 shall be used to quantify cyanide concentrations for compliance with all groundwater criteria. Total cyanide methods or method OIA-1677 shall be used to quantify cyanide concentrations for compliance with soil criteria. Nonresidential direct contact criteria may not be protective of the potential for release of hydrogen cyanide gas. Additional land or resource use restrictions may be necessary to protect for the acute inhalation concerns associated with hydrogen cyanide gas.

(Q) = Criteria for carcinogenic polycyclic aromatic hydrocarbons were developed using relative potential potencies to benzo(a)pyrene.

(R) = Hazardous substance may exhibit the characteristic of reactivity as defined in 40 C.F.R. §261.23 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost.

(T) = Refer to the federal Toxic Substances Control Act (TSCA), 40 C.F.R. §761, Subpart D and 40 C.F.R. §761, Subpart G, to determine the applicability of TSCA cleanup standards. Subpart D and Subpart G of 40 C.F.R. §761 (July 1, 2001) are adopted by reference in these rules and are available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulations may be purchased, at a cost as of the time of adoption of these rules of \$55, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401, or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost. Alternatives to compliance with the TSCA standards listed below are possible under 40 C.F.R. §761 Subpart D. New releases may be subject to the standards identified in 40 C.F.R. §761, Subpart G. Use Part 201 soil direct contact cleanup criteria in the published table if TSCA standards are not applicable.

(X) = The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information.)

(Z) = Mercury is typically measured as total mercury. The generic cleanup criteria, however, are based on data for different species of mercury. Specifically, data for elemental mercury, chemical abstract service (CAS) number 7439976, serve as the basis for the soil volatilization to indoor air criteria, groundwater volatilization to indoor air, and soil inhalation criteria. Data for methyl mercury, CAS number 22967926, serve as the basis for the GSI criterion; and data for mercuric chloride, CAS number 7487947, serve as the basis for the drinking water, groundwater contact, soil direct contact, and the groundwater protection criteria. Comparison to criteria shall be based on species-specific analytical data only if sufficient facility characterization has been conducted to rule out the presence of other species of mercury.

MSSL Footnotes:

J = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations must be added together for comparison to screening level.

JT = Hazardous substance may be present in several isomer forms. Screening levels may be used for the individual isomer provided that it is the sole isomer detected; however, when multiple isomers are detected in a medium, the isomer-specific concentrations must be added together and compared to the most restrictive screening level of the detected isomers.

M = The screening level may be below target detection limits (TDL).

Laboratory Footnotes:

J = The result is an estimated quantity.

U = Analyte analyzed for but not detected above the reported sample reporting limit.

UU = Analyte analyzed for but not detected above the reported sample reporting limit and is an estimated quantity.

TABLE 8-2  
Summary of Groundwater Analytical Results  
Area F  
Quincy Mining Company Portage Operations Area  
Abandoned Mining Wastes - Torch Lake Non-Superfund Site

Groundwater Table Footnotes:

- EGLE Part 201 residential and non-residential generic cleanup criteria and screening levels criteria were originally promulgated December 21, 2002 within the Administrative Rules for Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. This table reflects revisions to the criteria pursuant to the December 2010 Part 201 amendments and new criteria consistent with the provisions of R299.5706a. Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. Release Date: December 30, 2013. Updated December 21, 2020.

- Only detected analytes are listed - Gray rows indicate requested analyses. If no analytes are listed below a gray row then all analytes of that group were either not analyzed or not detected.

- **Bold** values are concentrations detected above the laboratory reporting limit.

- **Bold/Shaded** cells indicate analyte concentration exceeded applicable criteria. EGLE Part 201 criteria exceeded is indicated by the footnote in [brackets] following the result value and defined below:

Groundwater Table Footnotes:

ID = Insufficient data to develop criterion.

NA = A criterion or value is not available

NLV = Hazardous substance is not likely to volatilize under most conditions.

(A) = Criterion is the state of Michigan drinking water standard established pursuant to Section 5 of 1976 PA 399, MCL 325.1005.

(AA) = Use 10,000 ug/l where groundwater enters a structure through the use of a water well, sump or other device. Use 28,000 ug/l for all other uses.

(B) = Background, as defined in R 299.1(b), may be substituted if higher than the calculated cleanup criterion. Background levels may be less than criteria for some inorganic compounds.

(D) = Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).

(E) = Criterion is the aesthetic drinking water value, as required by Section 20120a(5) of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (NREPA). A notice of aesthetic impact may be employed as an institutional control mechanism if groundwater concentrations exceed the aesthetic drinking water criterion, but do not exceed the applicable health-based drinking water value provided in a table available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information)

(FF) = The chloride GSI criterion shall be 125 mg/l when the discharge is to surface waters of the state designated as public water supply sources or 50 mg/l when the discharge is to the Great Lakes or connecting waters. Chloride GSI criteria shall not apply for surface waters of the state that are not designated as a public water supply source, however, the total dissolved solids criterion is applicable.

(G) = Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. Where water hardness exceeds 400 mg CaCO<sub>3</sub>/L, use 400 mg CaCO<sub>3</sub>/L for the FCV calculation. The FCV formula provides values in units of ug/L or ppb. The generic GSI criterion is the lesser of the calculated FCV, the wildlife value (WV), and the surface water human non-drinking water value (HNDV). The soil GSI protection criteria for these hazardous substances are the greater of the 20 times the GSI criterion or the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote. A spreadsheet that may be used to calculate GSI and GSI protection criteria for (G)-footnoted hazardous substances is available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. A hardness value of 47.5 CaCO<sub>3</sub>/L and pH of 7, derived from the Michigan Department of Environmental Quality Draft Site Inspection Report for Lake Linden Operations dated 3/29/13, was used in the footnote G calculation spreadsheet.

(H) = Valence-specific chromium data (Cr III and Cr VI) shall be compared to the corresponding valence-specific cleanup criteria. If both Cr III and Cr VI are present in groundwater, the total concentration of both cannot exceed the drinking water criterion of 100 ug/L. If analytical data are provided for total chromium only, they shall be compared to the cleanup criteria for Cr VI. Cr III soil cleanup criterion for protection of drinking water can only be used at sites where groundwater is prevented from being used as a public water supply, currently and in the future, through an approved land or resource use restriction.

(HH) = The residential criterion for sodium is 230,000 ug/l in accordance with the Sodium Advisory Council recommendation and revised Groundwater Discharge Standards.

(I) = Hazardous substance may exhibit the characteristic of ignitability as defined in 40 C.F.R. §261.21 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, Remediation and Redevelopment Division (RRD), 525 West Allegan Street, Lansing, Michigan 48933, at cost.

(J) = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations shall be added together for comparison to criteria.

(L) = Criteria for lead are derived using a biologically based model, as allowed for under Section 20120a(9) of the NREPA, and are not calculated using the algorithms and assumptions specified in pathway-specific rules. The generic residential drinking water criterion of 4 ug/L is linked to the generic residential soil direct contact criterion of 400 mg/kg. A higher concentration in the drinking water, up to the state action level of 15 ug/L, may be allowed as a site-specific remedy and still allow for drinking water use, under Section 20120a(2) and 20120b of the NREPA if soil concentrations are appropriately lower than 400 mg/kg. If a site-specific criterion is approved based on this subdivision, a notice shall be filed on the deed for all property where the groundwater concentrations will exceed 4 ug/L to provide notice of the potential for unacceptable risk if soil or groundwater concentrations increase.

Acceptable combinations of site-specific soil and drinking water concentrations are presented in a table available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site (See R 299.49 Footnotes for generic cleanup criteria tables for additional information).

(M) = Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.

(Q) = Criteria for carcinogenic polycyclic aromatic hydrocarbons were developed using relative potential potencies to benzo(a)pyrene.

(S) = Criterion defaults to the hazardous substance-specific water solubility limit.

(T) = Refer to the federal Toxic Substances Control Act (TSCA), 40 C.F.R. §761, Subpart D and 40 C.F.R. §761, Subpart G, to determine the applicability of TSCA cleanup standards. Subpart D and Subpart G of 40 C.F.R. §761 (July 1, 2001) are adopted by reference in these rules and are available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulations may be purchased, at a cost as of the time of adoption of these rules of \$55, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401, or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost. Alternatives to compliance with the TSCA standards listed below are possible under 40 C.F.R. §761 Subpart D. New releases may be subject to the standards identified in 40 C.F.R. §761, Subpart G. Use Part 201 soil direct contact cleanup criteria in the published table if TSCA standards are not applicable.

(X) = The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information.)

(Z) = Mercury is typically measured as total mercury. The generic cleanup criteria, however, are based on data for different species of mercury. Specifically, data for elemental mercury, chemical abstract service (CAS) number 7439976, serve as the basis for the soil volatilization to indoor air criteria, groundwater volatilization to indoor air, and soil inhalation criteria. Data for methyl mercury, CAS number 22967926, serve as the basis for the GSI criterion; and data for mercuric chloride, CAS number 7487947, serve as the basis for the drinking water, groundwater contact, soil direct contact, and the groundwater protection criteria. Comparison to criteria shall be based on species-specific analytical data only if sufficient facility characterization has been conducted to rule out the presence of other species of mercury.

MSSL Footnotes:

GW = The calculated value for a hazardous substance based upon shallow groundwater is considered protective when it is greater than the calculated value for groundwater.

J = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations must be added together for comparison to screening level.

JT = Hazardous substance may be present in several isomer forms. Screening levels may be used for the individual isomer provided that it is the sole isomer detected; however, when multiple isomers are detected in a medium, the isomer-specific concentrations must be added together and compared to the most restrictive screening level of the detected isomers.

Laboratory Footnotes:

U = Analyte analyzed for but not detected above the reported sample reporting limit.

## 9. DETAILED FINDINGS – AREA H

This Section summarizes the results and the subsequent findings for Area H within QMCP derived from implementation of the SAP. The narrative follows the systematic investigative approach outlined in **Section 3**, while providing specific details about the potential human health and ecological risks associated with the historical mining operations in this subarea of QMCP.

### 9.1 SITE INSPECTION AND INVESTIGATION RESULTS

The implementation of the site inspection and investigation activities provided critical lines of evidence that link the historical documentation and the current environmental conditions in and around the Portage Canal. The following subsections present the findings of the inspection and investigation activities and provide correlation of mining era operations and their potential impacts on the nearshore and offshore environment of the Portage Canal.

#### 9.1.1 Site Inspection

The site inspection at each subarea included the inventory and locating of historical structures and similar surficial artifacts associated with the former industrial operations in the area. Each subarea was also inspected for potential physical and health hazards that were documented, photographed, and located with a GPS unit. The inventoried hazards were then qualitatively assessed for potential human health and environmental risks to determine if analytical sampling was warranted during the targeted inspection phase of the work.

On September 25, 2018, MSG field team personnel performed reconnaissance activities at Area H. In the case where access was not requested based on historic operational and investigative findings, property conditions were evaluated from a neighboring property or public right of way where access was permitted. Access to Area H was not requested based on historic operational and investigative findings.

The property parcel known as the Wuebben Property totaling approximately 10 acres was visually inspected and observations were recorded from the MDNR public trail property. The qualitative assessment of the reconnaissance findings in Area H did not warrant the performance of targeted inspection activities. The following provides a summary of the findings associated with the reconnaissance activities. A copy of the reconnaissance log is provided in **Appendix C, Site Inspections – Reconnaissance Logs, Targeted Inspections & Physical Hazards Inventory**.

##### 9.1.1.1 Reconnaissance

The reconnaissance activities did not identify any potentially abandoned containers or other environmental concerns during the review of Area H. Therefore, the reconnaissance findings did not warrant the performance of limited targeted inspection activities.

#### 9.1.2 Site Investigation

The SI in the QMCP was developed based on a variety of data and information as outlined in **Section 3**. In addition to the historical accounts and documentation, current land use and potential exposure pathways were also taken into consideration when considering potential sampling locations. Due to this, along with findings associated with previous investigations, additional samples were not collected during SI activities in Area H. The following subsections present the outcomes of historic investigative activities completed in Area H by summarizing the laboratory analytical results and characterizing their impacts on the environmental media in which they were detected.

### 9.1.2.1 Historic Investigations

Following a review of available historic Sanborn Maps and other resources, historic land use and/or operations within Area H were unknown.

Inorganic COCs in the study area were generally understood in areas where previous investigations had been completed. Only limited data related to the COCs on the property was available.

A detailed summary of analytical results for the seven historic soil samples collected from Area H is provided in **Table 9-1, Summary of Soil Analytical Results (Area H)**. Historic soil analytical results are depicted on **Figure 9-1, Soil Analytical Results (Area H)**. A detailed summary of historic analytical data for eight groundwater samples is provided in **Table 9-2, Summary of Groundwater Analytical Results (Area H)** and is depicted on **Figure 9-2, Groundwater Analytical Results (Area H)**.

## 9.2 NATURE AND EXTENT OF CONTAMINATION

Utilizing the established regulatory criteria presented in **Section 4** for various land use categories and exposure pathways, the historic laboratory analytical results summarized in the preceding section for Area H were reviewed and compared to EGLE Cleanup Criteria Requirements for Response Activity as applicable for the sampled environmental media.

### 9.2.1 Comprehensive Exposure Assessment

The comparison was completed to determine which ecological and human exposure pathways, risks, and conditions are relevant at Area H. Although not inclusive of relevant pathways where regulatory criteria were not exceeded, the following exposure pathways were determined to be relevant in Area H:

- Risks posed by hazardous substances in soil and the potential for the substances to leach to groundwater that could vent to surface water.

As discussed in **Section 4.2.5**, EGLE drinking water and groundwater/surface water pathway criteria exceedances for metals were excluded from the soil and groundwater evaluation. The rationale for this exclusion is twofold:

- The Project investigation and anticipated response actions are being undertaken pursuant to Part 201 of NREPA, being PA 451 of 1994, as amended. The concentrations of metals in excess of the EGLE drinking water and groundwater/surface water pathway criteria are ubiquitous in the study area and are predominantly the result of the presence of stamp sands. Stamp sands are not defined as a hazardous substance nor are subject to regulation under Part 201 unless the property otherwise contains hazardous substances in excess of concentrations that satisfy the cleanup criteria for unrestricted residential use; and,
- The study area is part of OU 2 for which the EPA ROD remedy called for No Action. The EPA's ROD OU 2 includes groundwater, surface water, submerged tailings and sediments in Torch Lake, Portage Lake, the Portage Canal, and other area water bodies. Note that EPA's No Action determination relies on the following to mitigate the effects of stamp sand to the extent practicable:
  - The reduction of stamp sand loading to surface water bodies expected as a result of the remedial action taken at OU 1 and OU 3.
  - Ongoing natural sedimentation and detoxification.

- Institutional programs and practices controlling potential future exposure to site-affected drinking water which were intended to be administered at the county and state level.
- The long-term monitoring and the five-year review process monitoring requirements of the remedy selected for OU 1 and OU 3 under the 1992 ROD.

Note that metals criteria for other relevant pathways, and cyanide and organic contaminants for all pathways were included in the evaluation.

Furthermore, as discussed in **Section 4.2.5**, EGLE's MSSLs were not included in the exposure pathway assessment due to unknown anticipated future land use and conditions. The MSSLs were considered for screening and delineation purposes only.

#### 9.2.1.1 Soil Exposure Pathway Assessment

Historical soil analytical results from Area H identified COC concentrations in soil that were at or above concentrations that trigger a "Facility" designation as defined in Section 20101(1)(s) of the NREPA. The following tables provide an aggregate summary of the soil sample locations with respect to the total number of samples and how they compare to the applicable EGLE Cleanup Criteria for Response Activity under both Residential and Nonresidential exposure scenarios. The tables are based solely on the total number of samples, inclusive of historical samples, collected from Area H. They list only the number of samples for a specific analytical suite that contained one or more exceedance of a given criterion.

| Soil Analytical Result Summary Table                                 | Cleanup Criteria Requirements for Response Activity – Residential** |                    |                    |                                                |                                                         |                                                       |                                                          |                                          |                                          |                                      |                         |                                                |

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the groundwater evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSLs or non-applicable criteria (DWPC and GSIPC for metals).

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the groundwater evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSLs or non-applicable criteria (DWPC and GSIPC for metals).

#### 9.2.1.2 Groundwater Exposure Pathway Assessment

Groundwater analytical results from Area H did not include COC concentrations in groundwater that were at or above concentrations that trigger a “Facility” designation as defined in Section 20101(1)(s) of the NREPA. Similar to the preceding soil tables, the following table provides a summary of the aforementioned sample locations with respect to the total number of samples and how they compare to the applicable EGLE Cleanup Criteria for Response Activity under both Residential and Nonresidential exposure scenarios.

| Groundwater Analytical Result Summary Table                          | Analytical Summary      |                                    |                    | Cleanup Criteria Requirements for Response Activity – Residential and Nonresidential** |                                        |                                              |                                                                          |                                                                             |                  |                                               |

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the groundwater evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSLS or non-applicable criteria (DWC and GSIC for metals).

## 9.2.2 Extent of Contamination

The comparison of historic analytical results to applicable regulatory criteria indicates that potential human health and ecological risks are present in soil in at least one location in Area H. Recalling the goals and objectives of the SI, the following subsections describe the extent of contamination in environmental media in the study area.

### 9.2.2.1 Soil Extent of Contamination

Drawing upon historic analytical data only, soil analytical results for organic contaminants exceeded GSIPC at one location (GP-1). Additionally, historic analytical results indicate that mercury was detected exceeding residential and nonresidential MSSLS at four (4) total locations and VOCs exceeded residential and nonresidential MSSLS at one location (GP-1).

Most of the samples were collected from subsurface soil intervals from areas that are generally accessible to the public despite being a privately-owned property. The sampling locations were within approximately 50 ft to 300 ft of the shoreline of the Portage Canal.

In the case of Area H, elevated concentrations of inorganic and VOC contaminants potentially include exposure risks related to inhalation pathways, which must be a consideration when evaluating land use, property accessibility, and the extent of contamination in surface and near surface soils that could be encountered through normal use of the property.

The remaining exposure risks are generally related to the leaching of contaminants to groundwater and their potential impacts on surface water; however, the extent of VOC contaminants have not been fully investigated. These risks pose a long-term threat to the overall environmental health of the watershed. The widespread distribution of inorganic COCs throughout the region limit determinations related to the extent of contamination in Area H.

#### 9.2.2.2 *Groundwater Extent of Contamination*

Historical groundwater analytical results did not exceed EGLE Part 201 Clean up Criteria for Response Action; however, the mercury detection exceeded shallow groundwater MSSLs for residential and nonresidential exposure pathways at one location (MW-1).

No other analyzed constituents were detected above EGLE criteria within Area H. Groundwater depths were not available for historic sample locations. The groundwater sampling locations were established in a zone roughly 50 ft to 300 ft to the shoreline of the Portage Canal.

### 9.3 **CONCLUSIONS AND RECOMMENDATIONS**

The analytical results and interpretation summarized in the preceding subsections document potential human health and ecological risks that are present in Area H. The following subsections provide a synopsis of these findings and a recommended path forward for mitigating these risks in Area H.

#### 9.3.1 **Conclusions**

Environmental impacts in Area H are generally characterized by detections of organic and inorganic contaminants in soil. Specific sources of these contaminants are not fully understood.

The historic analytical results summarized above provide sufficient analytical data and lines of evidence to conclude that the study area is a "Facility" as defined in Section 20101(1)(s) of the NREPA. The following table provides a summary of the affected environmental media, applicable regulatory criteria, and potential receptors within Area H.

| Area H – Media, Criteria, Potential Receptor Summary                 |                           |                                     |                |                                        |                                     |                              |                |                        |            |               |              |                                                        |                              |               |              |

| Benthic Organism                                                     |                           |                                     |                |                                        |                                     |                              |                |                        |            |               |              |                                                        |                              |               |              |
| COCs exceeding applicable regulatory criteria in one or more samples |                           |                                     |                | 1,2,4-TRIMETHYLBENZENE, XYLENE - TOTAL |                                     |                              |                |                        |            |               |              |                                                        |                              |               |              |

In addition to the evaluation of historical analytical results evaluated from Area H, the following provides a summary of findings derived from the assessment of Area H with respect to the goals and objectives for the Project:

- Terrestrial sources of contamination are present in the form of VOCs and limited inorganic COCs in the study area. Based on the availability of historic analytical data, the extent of contamination around the GP-1 sampling location in Area H does not appear to have been fully investigated.
- Soil impacts on the MDNR trail property exceeded MSSLs for residential and nonresidential scenarios but did not exceed PSIC or DCC.

### 9.3.2 Recommendations

The conclusions outlined in the preceding subsection establish that Area H is a Part 201 Facility. Section 20107a of Part 201 of NREPA describes the duties of owners or operators of a Facility, regardless of their liability, including: prevent unacceptable exposures, prevent exacerbation, and take reasonable precautions against the foreseeable actions of third parties. Some exceptions may apply; in any case, owners and operators of contaminated properties should become familiar with Section 20107a and the associated Rules.

Note: Analytical and Criteria Footnotes are included on the last page of the table.

TABLE 9-1  
Summary of Soil Analytical Results  
Area H  
Quincy Mining Company Portage Operations Area  
Abandoned Mining Wastes - Torch Lake Non-Superfund Site

Soil Table Footnotes:

- EGLE Part 201 residential and non-residential generic cleanup criteria and screening levels criteria were originally promulgated December 21, 2002 within the Administrative Rules for Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. This table reflects revisions to the criteria pursuant to the December 2010 Part 201 amendments and new criteria consistent with the provisions of R299.5706a. Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. Release Date: December 30, 2013. Updated June 2018.

- Only detected analytes are listed - Gray rows indicate requested analyses. If no analytes are listed below a gray row then all analytes of that group were either not analyzed or not detected.

- **Bold** values are concentrations detected above the laboratory reporting limit.

- **Bold/Shaded** cells indicate analyte concentration exceeded applicable criteria. EGLE Part 201 criteria exceeded is indicated by the footnote in [brackets] following the result value and defined below:

- |                                                                                |                                                                                    |

| [10] - Residential Direct Contact Criteria                                     | [19] - Soil Nonresidential MSSL                                                    |

Evaluation based on EGLE Criteria at time of Project completion.

Samples described in this evaluation may actually refer to stamp sands or to other mining waste from the historic mining and reclamation processes conducted in the area.

- |                                  |                                                                                   |
|----------------------------------|-----------------------------------------------------------------------------------|

Criteria Footnotes:

- ID = Insufficient data to develop criterion.
- NA = A criterion or value is not available
- NLL = Hazardous substance is not likely to leach under most soil conditions.
- (B) = Background, as defined in R 299.1(b), may be substituted if higher than the calculated cleanup criterion. Background levels may be less than criteria for some inorganic compounds.
- (BB) = The state drinking water standard for asbestos (fibers greater than 10 micrometers in length) is in units of a million fibers per liter of water (MFL). Soil concentrations of asbestos are determined by polarized light microscop.
- (C) = The criterion developed under R 299.20 to R 299.26 exceeds the chemical- specific soil saturation screening level (Csat). The person proposing or implementing response activity shall document whether additional response activity is required to control free-phase liquids or NAPL to protect against risks associated with free-phase liquids by using methods appropriate for the free-phase liquids present. Development of a site-specific Csat or methods presented in R 299.22, R 299.24(5), and R 299.26(8) may be conducted for the relevant exposure pathways.
- (D) = Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).
- (DD) = Hazardous substance causes developmental effects. Residential direct contact criteria are protective of both prenatal and postnatal exposure. Nonresidential direct contact criteria are protective for a pregnant adult receptor.
- (F) = Criterion is based on adverse impacts to plant life and phytotoxicity.
- (G) = Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. Where water hardness exceeds 400 mg Ca<sub>4</sub>/L, use 400 mg CaCO<sub>3</sub>/L for the FCV calculation. The FCV formula provides values in units of ug/L or ppb. The generic GSI criterion is the lesser of the calculated FCV, the wildlife value (WV), and the surface water human non-drinking water value (HNDV). The soil GSI protection criteria for these hazardous substances are the greater of the 20 times the GSI criterion or the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote. A spreadsheet that may be used to calculate GSI and GSI protection criteria for (G)-footnoted hazardous substances is available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. A hardness value of 47.5 CaC<sub>4</sub>L and pH of 7, derived from the Michigan Department of Environmental Quality Draft Site Inspection Report for Lake Linden Operations dated 3/29/13, was used in the footnote G calculation spreadsheet.
- (H) = Valence-specific chromium data (Cr III and Cr VI) shall be compared to the corresponding valence-specific cleanup criteria. If both Cr III and Cr VI are present in groundwater, the total concentration of both cannot exceed the drinking water criterion of 100 ug/L. If analytical data are provided for total chromium only, they shall be compared to the cleanup criteria for Cr VI. Cr III soil cleanup criterion for protection of drinking water can only be used at sites where groundwater is prevented from being used as a public water supply, currently and in the future, through an approved land or resource use restriction.
- (I) = Hazardous substance may exhibit the characteristic of ignitability as defined in 40 C.F.R. §261.21 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, Remediation and Redevelopment Division (RRD), 525 West Allegan Street, Lansing, Michigan 48933, at cost.
- (J) = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations shall be added together for comparison to criteria.
- (M) = Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.
- (P) = Amenable cyanide methods or method OIA-1677 shall be used to quantify cyanide concentrations for compliance with all groundwater criteria. Total cyanide methods or method OIA-1677 shall be used to quantify cyanide concentrations for compliance with soil criteria. Nonresidential direct contact criteria may not be protective of the potential for release of hydrogen cyanide gas. Additional land or resource use restrictions may be necessary to protect for the acute inhalation concerns associated with hydrogen cyanide gas.
- (Q) = Criteria for carcinogenic polycyclic aromatic hydrocarbons were developed using relative potential potencies to benzo(a)pyrene.
- (R) = Hazardous substance may exhibit the characteristic of reactivity as defined in 40 C.F.R. §261.23 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost.
- (T) = Refer to the federal Toxic Substances Control Act (TSCA), 40 C.F.R. §761, Subpart D and 40 C.F.R. §761, Subpart G, to determine the applicability of TSCA cleanup standards. Subpart D and Subpart G of 40 C.F.R. §761 (July 1, 2001) are adopted by reference in these rules and are available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulations may be purchased, at a cost as of the time of adoption of these rules of \$55, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401, or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost. Alternatives to compliance with the TSCA standards listed below are possible under 40 C.F.R. §761 Subpart D. New releases may be subject to the standards identified in 40 C.F.R. §761, Subpart G. Use Part 201 soil direct contact cleanup criteria in the published table if TSCA standards are not applicable.
- (X) = The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information.)
- (Z) = Mercury is typically measured as total mercury. The generic cleanup criteria, however, are based on data for different species of mercury. Specifically, data for elemental mercury, chemical abstract service (CAS) number 7439976, serve as the basis for the soil volatilization to indoor air criteria, groundwater volatilization to indoor air, and soil inhalation criteria. Data for methyl mercury, CAS number 22967926, serve as the basis for the GSI criterion; and data for mercuric chloride, CAS number 7487947, serve as the basis for the drinking water, groundwater contact, soil direct contact, and the groundwater protection criteria. Comparison to criteria shall be based on species-specific analytical data only if sufficient facility characterization has been conducted to rule out the presence of other species of mercury.

MSSL Footnotes:

- J = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations must be added together for comparison to screening level.
- JT = Hazardous substance may be present in several isomer forms. Screening levels may be used for the individual isomer provided that it is the sole isomer detected; however, when multiple isomers are detected in a medium, the isomer-specific concentrations must be added together and compared to the most restrictive screening level of the detected isomers.
- M = The screening level may be below target detection limits (TDL).

Laboratory Footnotes:

- J = The result is an estimated quantity.
- U = Analyte analyzed for but not detected above the reported sample reporting limit.
- UU = Analyte analyzed for but not detected above the reported sample reporting limit and is an estimated quantity.

Note: Analytical and Criteria Footnotes are included on the last page of the table.

TABLE 9-2  
Summary of Groundwater Analytical Results  
Area H  
Quincy Mining Company Portage Operations Area  
Abandoned Mining Wastes - Torch Lake Non-Superfund Site

Groundwater Table Footnotes:

- EGLE Part 201 residential and non-residential generic cleanup criteria and screening levels criteria were originally promulgated December 21, 2002 within the Administrative Rules for Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. This table reflects revisions to the criteria pursuant to the December 2010 Part 201 amendments and new criteria consistent with the provisions of R299.5706a. Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. Release Date: December 30, 2013. Updated December 21, 2020.

- Only detected analytes are listed - Gray rows indicate requested analyses. If no analytes are listed below a gray row then all analytes of that group were either not analyzed or not detected.

- **Bold** values are concentrations detected above the laboratory reporting limit.

- **Bold/Shaded** cells indicate analyte concentration exceeded applicable criteria. EGLE Part 201 criteria exceeded is indicated by the footnote in [brackets] following the result value and defined below:

|                                                                                   |                                                    |
|-----------------------------------------------------------------------------------|----------------------------------------------------|
| [1] - Residential Drinking Water Criteria                                         | [8] Shallow Groundwater Residential MSSL           |
| [2] - Nonresidential Drinking Water Criteria                                      | [9] Shallow Groundwater Nonresidential MSSL        |
| [3] - Groundwater Surface Water Interface Criteria                                | [10] Groundwater Residential MSSL                  |
| [4] - Water Solubility                                                            | [11] Groundwater Residential TS MSSL               |
| [5] - Residential Groundwater Volatilization to Indoor Air Inhalation Criteria    | [12] Groundwater Nonresidential MSSL               |
| [6] - Nonresidential Groundwater Volatilization to Indoor Air Inhalation Criteria | [13] Groundwater Nonresidential MSSL <sub>12</sub> |
| [7] - Flammability and Explosivity Screening Level                                | [14] Groundwater Nonresidential TS MSSL            |

Evaluation based on EGLE Criteria at time of Project completion.

Groundwater Table Footnotes:

ID = Insufficient data to develop criterion.

NA = A criterion or value is not available

NLV = Hazardous substance is not likely to volatilize under most conditions.

(A) = Criterion is the state of Michigan drinking water standard established pursuant to Section 5 of 1976 PA 399, MCL 325.1005.

(AA) = Use 10,000 ug/l where groundwater enters a structure through the use of a water well, sump or other device. Use 28,000 ug/l for all other uses.

(B) = Background, as defined in R 299.1(b), may be substituted if higher than the calculated cleanup criterion. Background levels may be less than criteria for some inorganic compounds.

(D) = Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).

(E) = Criterion is the aesthetic drinking water value, as required by Section 20120a(5) of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (NREPA). A notice of aesthetic impact may be employed as an institutional control mechanism if groundwater concentrations exceed the aesthetic drinking water criterion, but do not exceed the applicable health-based drinking water value provided in a table available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information)

(FF) = The chloride GSI criterion shall be 125 mg/l when the discharge is to surface waters of the state designated as public water supply sources or 50 mg/l when the discharge is to the Great Lakes or connecting waters. Chloride GSI criteria shall not apply for surface waters of the state that are not designated as a public water supply source, however, the total dissolved solids criterion is applicable.

(G) = Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. Where water hardness exceeds 400 mg CaCO<sub>3</sub>/L, use 400 mg CaCO<sub>3</sub>/L for the FCV calculation. The FCV formula provides values in units of ug/L or ppb. The generic GSI criterion is the lesser of the calculated FCV, the wildlife value (WV), and the surface water human non-drinking water value (HNDV). The soil GSI protection criteria for these hazardous substances are the greater of the 20 times the GSI criterion or the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote. A spreadsheet that may be used to calculate GSI and GSI protection criteria for (G)-footnoted hazardous substances is available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. A hardness value of 47.5 CaCO<sub>3</sub>/L and pH of 7, derived from the Michigan Department of Environmental Quality Draft Site Inspection Report for Lake Linden Operations dated 3/29/13, was used in the footnote G calculation spreadsheet.

(H) = Valence-specific chromium data (Cr III and Cr VI) shall be compared to the corresponding valence-specific cleanup criteria. If both Cr III and Cr VI are present in groundwater, the total concentration of both cannot exceed the drinking water criterion of 100 ug/L. If analytical data are provided for total chromium only, they shall be compared to the cleanup criteria for Cr VI. Cr III soil cleanup criterion for protection of drinking water can only be used at sites where groundwater is prevented from being used as a public water supply, currently and in the future, through an approved land or resource use restriction.

(HH) = The residential criterion for sodium is 230,000 ug/l in accordance with the Sodium Advisory Council recommendation and revised Groundwater Discharge Standards.

(I) = Hazardous substance may exhibit the characteristic of ignitability as defined in 40 C.F.R. §261.21 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, Remediation and Redevelopment Division (RRD), 525 West Allegan Street, Lansing, Michigan 48933, at cost.

(J) = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations shall be added together for comparison to criteria.

(L) = Criteria for lead are derived using a biologically based model, as allowed for under Section 20120a(9) of the NREPA, and are not calculated using the algorithms and assumptions specified in pathway-specific rules. The generic residential drinking water criterion of 4 ug/L is linked to the generic residential soil direct contact criterion of 400 mg/kg. A higher concentration in the drinking water, up to the state action level of 15 ug/L, may be allowed as a site-specific remedy and still allow for drinking water use, under Section 20120a(2) and 20120b of the NREPA if soil concentrations are appropriately lower than 400 mg/kg. If a site-specific criterion is approved based on this subdivision, a notice shall be filed on the deed for all property where the groundwater concentrations will exceed 4 ug/L to provide notice of the potential for unacceptable risk if soil or groundwater concentrations increase.

Acceptable combinations of site-specific soil and drinking water concentrations are presented in a table available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site (See R 299.49 Footnotes for generic cleanup criteria tables for additional information).

(M) = Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.

(Q) = Criteria for carcinogenic polycyclic aromatic hydrocarbons were developed using relative potential potencies to benzo(a)pyrene.

(S) = Criterion defaults to the hazardous substance-specific water solubility limit.

(T) = Refer to the federal Toxic Substances Control Act (TSCA), 40 C.F.R. §761, Subpart D and 40 C.F.R. §761, Subpart G, to determine the applicability of TSCA cleanup standards. Subpart D and Subpart G of 40 C.F.R. §761 (July 1, 2001) are adopted by reference in these rules and are available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulations may be purchased, at a cost as of the time of adoption of these rules of \$55, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401, or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost. Alternatives to compliance with the TSCA standards listed below are possible under 40 C.F.R. §761 Subpart D. New releases may be subject to the standards identified in 40 C.F.R. §761, Subpart G. Use Part 201 soil direct contact cleanup criteria in the published table if TSCA standards are not applicable.

(X) = The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information.)

(Z) = Mercury is typically measured as total mercury. The generic cleanup criteria, however, are based on data for different species of mercury. Specifically, data for elemental mercury, chemical abstract service (CAS) number 7439976, serve as the basis for the soil volatilization to indoor air criteria, groundwater volatilization to indoor air, and soil inhalation criteria. Data for methyl mercury, CAS number 22967926, serve as the basis for the GSI criterion; and data for mercuric chloride, CAS number 7487947, serve as the basis for the drinking water, groundwater contact, soil direct contact, and the groundwater protection criteria. Comparison to criteria shall be based on species-specific analytical data only if sufficient facility characterization has been conducted to rule out the presence of other species of mercury.

MSSL Footnotes:

GW = The calculated value for a hazardous substance based upon shallow groundwater is considered protective when it is greater than the calculated value for groundwater.

J = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations must be added together for comparison to screening level.

JT = Hazardous substance may be present in several isomer forms. Screening levels may be used for the individual isomer provided that it is the sole isomer detected; however, when multiple isomers are detected in a medium, the isomer-specific concentrations must be added together and compared to the most restrictive screening level of the detected isomers.

Laboratory Footnotes:

U = Analyte analyzed for but not detected above the reported sample reporting limit.

## 10. DETAILED FINDINGS – AREA J

This Section summarizes the results and the subsequent findings for Area J within QMCP derived from implementation of the SAP. The narrative follows the systematic investigative approach outlined in **Section 3**, while providing specific details about the potential human health and ecological risks associated with the historical mining operations in this subarea of QMCP.

### 10.1 SITE INSPECTION AND INVESTIGATION RESULTS

The implementation of the site inspection and investigation activities provided critical lines of evidence that link the historical documentation and the current environmental conditions in and around the Portage Canal. The following subsections present the findings of the inspection and investigation activities and provide correlation of mining era operations and their potential impacts on the nearshore and offshore environment of the Portage Canal.

#### 10.1.1 Site Inspection

The site inspection at each subarea included the inventory and locating of historical structures and similar surficial artifacts associated with the former industrial operations in the area. Each subarea was also inspected for potential physical and health hazards that were documented, photographed, and located with a GPS unit. The inventoried hazards were then qualitatively assessed for potential human health and environmental risks to determine if analytical sampling was warranted during the targeted inspection phase of the work.

On September 26, 2018, MSG field team personnel performed reconnaissance activities at Area J. In the case where access was not requested based on historic operational and investigative findings, property conditions were evaluated from a neighboring property or public right of way where access was permitted. Access to Area J was not requested based on historic operational and investigative findings.

The property parcel known as the H&Y Marina totaling approximately 10 acres was visually inspected and observations were recorded from the MDNR public trail property. The qualitative assessment of the reconnaissance findings in Area J did not warrant the performance of targeted inspection activities. The following provides a summary of the findings associated with the reconnaissance activities. A copy of the reconnaissance log is provided in **Appendix C, Site Inspections – Reconnaissance Logs, Targeted Inspections & Physical Hazards Inventory**.

##### 10.1.1.1 Reconnaissance

The reconnaissance did not identify any potentially abandoned containers or other environmental concerns during the review of Area J that appeared to be associated with Area J. Therefore, the reconnaissance findings did not warrant the performance of limited targeted inspection activities.

#### 10.1.2 Site Investigation

The SI in the QMCP was developed based on a variety of data and information as outlined in **Section 3**. In addition to the historical accounts and documentation, current land use and potential exposure pathways were also taken into consideration when considering potential sampling locations. Due to this, along with findings associated with previous investigations, additional samples were not collected during SI activities in Area J. The following subsections present the outcomes of historic investigative activities completed in Area J by summarizing the laboratory analytical results and characterizing their impacts on the environmental media in which they were detected.

### 10.1.2.1 Historic Investigations

Following a review of available historic Sanborn Maps and other resources, historic land use and/or operations within Area J included Houghton Lumber Yard Co., Dollar Bay Lumber Co., Henry Borth Co. Manufacturing Railroad Shims, and UP Oil Company.

Organic and inorganic COCs in the study area were generally not understood due to the limited sampling that was conducted as part of previous investigations. Previous investigative activities did not fully characterize contaminants in soil and did not include groundwater sampling.

A detailed summary of soil analytical results collected from Area J are provided in **Table 10-1**, *Summary of Soil Analytical Results (Area J)*. Historic soil analytical results are depicted on **Figure 10-1**, *Soil Analytical Results (Area J)*.

## 10.2 NATURE AND EXTENT OF CONTAMINATION

Utilizing the established regulatory criteria presented in **Section 4** for various land use categories and exposure pathways, the historic laboratory analytical results summarized in the preceding section for Area J were reviewed and compared to EGLE Cleanup Criteria Requirements for Response Activity as applicable for the sampled environmental media.

### 10.2.1 Comprehensive Exposure Assessment

The comparison was completed to determine which ecological and human exposure pathways, risks, and conditions are relevant at Area J. Although not inclusive of relevant pathways where regulatory criteria were not exceeded, the following exposure pathways were determined to be relevant in Area J:

- Risks posed by hazardous substances in soil and the potential for the substances to leach to groundwater that could vent to surface water.
- Risks posed by hazardous substances in soil and the potential for the substances to be inhaled if they are emitted as particulates and dispersed in ambient air in both residential and nonresidential settings.
- Risks posed by hazardous substances in soil and the potential for direct contact with these soils in a residential setting.

As discussed in **Section 4.2.5**, EGLE drinking water and groundwater/surface water pathway criteria exceedances for metals were excluded from the soil and groundwater evaluation. The rationale for this exclusion is twofold:

- The Project investigation and anticipated response actions are being undertaken pursuant to Part 201 of NREPA, being PA 451 of 1994, as amended. The concentrations of metals in excess of the EGLE drinking water and groundwater/surface water pathway criteria are ubiquitous in the study area and are predominantly the result of the presence of stamp sands. Stamp sands are not defined as a hazardous substance nor are subject to regulation under Part 201 unless the property otherwise contains hazardous substances in excess of concentrations that satisfy the cleanup criteria for unrestricted residential use; and,
- The study area is part of OU 2 for which the EPA ROD remedy called for No Action. The EPA's ROD OU 2 includes groundwater, surface water, submerged tailings and sediments in Torch Lake, Portage Lake, the Portage Canal, and other area water bodies. Note that EPA's No Action determination relies on the following to mitigate the effects of stamp sand to the extent practicable:

- The reduction of stamp sand loading to surface water bodies expected as a result of the remedial action taken at OU 1 and OU 3.
- Ongoing natural sedimentation and detoxification.
- Institutional programs and practices controlling potential future exposure to site-affected drinking water which were intended to be administered at the county and state level.
- The long-term monitoring and the five-year review process monitoring requirements of the remedy selected for OU 1 and OU 3 under the 1992 ROD.

Note that metals criteria for other relevant pathways, and cyanide and organic contaminants for all pathways were included in the evaluation.

Furthermore, as discussed in **Section 4.2.5**, EGLE's MSSLs were not included in the exposure pathway assessment due to unknown anticipated future land use and conditions. The MSSLs were considered for screening and delineation purposes only.

#### *10.2.1.1 Soil Exposure Pathway Assessment*

Historical soil analytical results from Area J identified COC concentrations in soil that were at or above concentrations that trigger a "Facility" designation as defined in Section 20101(1)(s) of the NREPA. The following tables provide an aggregate summary of the soil sample locations with respect to the total number of samples and how they compare to the applicable EGLE Cleanup Criteria for Response Activity under both Residential and Nonresidential exposure scenarios. The tables are based solely on the total number of samples, inclusive of historical samples, collected from Area J. They list only the number of samples for a specific analytical suite that contained one or more exceedance of a given criterion.

| Soil Analytical Result Summary Table                                 | Cleanup Criteria Requirements for Response Activity – Residential** |                    |                    |                                                |                                                         |                                                       |                                                          |                                          |                                          |                                      |                         |                                                |

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the groundwater evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSLS or non-applicable criteria (DWPC and GSIPC for metals).

(Y) Source size modifiers listed below shall be used to determine soil inhalation criteria for ambient air when the source size is not one-half acre. The modifier shall be multiplied by the generic soil inhalation criteria shown in the table of generic cleanup criteria to determine the applicable criterion. Source Size square feet (sqft) or acres: Modifier 400 sqft 3.17, 1000 sqft 2.2, 2000 sqft 1.76, 1/4 acre 1.15, 1/2 acre 1, 1 acre 0.87, 2 acre 0.77, 5 acre 0.66, 10 acre 0.6, 32 acre 0.5, 100 acre 0.43.

| COCs exceeding applicable regulatory criteria in one or more samples |                                                                        |                    |                    | MANGANESE, NAPHTHALENE (VOC)                      |                                                         |                                                       |                                                          |                                          |                                          |                                      |                         |                                                |

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the groundwater evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSLS or non-applicable criteria (DWPC and GSIPC for metals).

(Y) Source size modifiers listed below shall be used to determine soil inhalation criteria for ambient air when the source size is not one-half acre. The modifier shall be multiplied by the generic soil inhalation criteria shown in the table of generic cleanup criteria to determine the applicable criterion. Source Size square feet (sqft) or acres: Modifier 400 sqft 3.17, 1000 sqft 2.2, 2000 sqft 1.76, 1/4 acre 1.15, 1/2 acre 1, 1 acre 0.87, 2 acres 0.77, 5 acres 0.66, 10 acre 0.6, 32 acres 0.5, 100 acres 0.43.

## 10.2.2 Extent of Contamination

The comparison of historic analytical results to applicable regulatory criteria indicates that potential human health and ecological risks are present in soil in Area J. Recalling the goals and objectives of the SI, the following subsections describe the extent of contamination in environmental media in the study area.

### 10.2.2.1 Soil Extent of Contamination

Drawing upon historic analytical data only, soil analytical results exceeded GSIPC, residential DCC, residential and nonresidential MSSLS, and PSIC in both residential and nonresidential exposure scenarios. The predominant contaminants were inorganic compounds, with manganese exceeding residential and nonresidential PSIC at sample location H&Y Marina-19 in the western portion of Area J. Arsenic and lead were detected above residential DCC and PCBs were also detected at this sample location but did not exceed criteria. Additionally, VOCs at concentrations above GSIPC and residential and/or nonresidential MSSLS were detected at sample location SS-30 on the MDNR trail

property in the eastern portion of Area J. The limits of inorganic and VOC impact, respectively, at these two locations have not been defined.

All samples were collected from surface soil intervals that are generally accessible to the public despite being a privately-owned property. The sampling locations were within approximately 75 ft to 350 ft of the shoreline of the Portage Canal.

In the case of Area J, elevated concentrations of inorganic and VOC contaminants potentially include exposure risks related to inhalation and dermal contact pathways, which must be a consideration when evaluating land use, property accessibility, and the extent of contamination in surface and near surface soils that could be encountered through normal use of the property.

The remaining exposure risks are generally related to the leaching of contaminants to groundwater and their potential impacts on surface water; however, as stated before, VOC contaminants have not been fully investigated. These risks pose a long-term threat to the overall environmental health of the watershed. The widespread distribution of inorganic COCs throughout the region limit determinations related to the extent of contamination in Area J. Nevertheless, risks posed to groundwater and surface water are relevant and are a factor when evaluating the extent of soil contamination in the Area J.

### **10.3 CONCLUSIONS AND RECOMMENDATIONS**

The analytical results and interpretation summarized in the preceding subsections document potential human health and ecological risks that are present in Area J. The following subsections provide a synopsis of these findings and a recommended path forward for mitigating these risks in Area J.

#### **10.3.1 Conclusions**

Environmental impacts in Area J are generally characterized by detections of organic and inorganic contaminants in soil. Groundwater has not been sampled in Area J. Although specific sources of these contaminants may not be fully understood, historical research related to the operations provided substantive evidence for assessing specific operational areas and selecting target analytes anticipated to be present within the study area.

The historic analytical results summarized above provide sufficient analytical data and lines of evidence to conclude that the study area is a "Facility" as defined in Section 20101(1)(s) of the NREPA. The following table provides a summary of the affected environmental media, applicable regulatory criteria, and potential receptors within Area J.

| Area J – Media, Criteria, Potential Receptor Summary                |                           |                                     |                |                                             |                                     |                              |                |                        |            |               |              |                                                        |                              |               |

In addition to the evaluation of historical analytical results evaluated from Area J, the following provides a summary of findings derived from the assessment of Area J with respect to the goals and objectives for the Project:

- Terrestrial sources of contamination are present in the form of VOCs and inorganic COCs in the study area. Based on the availability of historic analytical data, the extent of contamination in Area J does not appear to have been fully investigated.
- Soil impacts on the MDNR trail property exceeded GSIPC and MSSSLs for residential and nonresidential scenarios but did not exceed PSIC or DCC.

### 10.3.2 Recommendations

The conclusions outlined in the preceding subsection establish that Area J is a Part 201 Facility. Section 20107a of Part 201 of NREPA describes the duties of owners or operators of a Facility, regardless of their liability, including: prevent unacceptable exposures, prevent exacerbation, and take reasonable precautions against the foreseeable actions of third parties. Some exceptions may apply; in any case, owners and operators of contaminated properties should become familiar with Section 20107a and the associated Rules.

Note: Analytical and Criteria Footnotes are included on the last page of the table.

TABLE 10-1  
Summary of Soil Analytical Results  
Area J  
Quincy Mining Company Portage Operations Area  
Abandoned Mining Wastes - Torch Lake Non-Superfund Site

Soil Table Footnotes:

- EGLE Part 201 residential and non-residential generic cleanup criteria and screening levels criteria were originally promulgated December 21, 2002 within the Administrative Rules for Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. This table reflects revisions to the criteria pursuant to the December 2010 Part 201 amendments and new criteria consistent with the provisions of R299.5706a. Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. Release Date: December 30, 2013. Updated June 2018.

- Only detected analytes are listed - Gray rows indicate requested analyses. If no analytes are listed below a gray row then all analytes of that group were either not analyzed or not detected.

- **Bold** values are concentrations detected above the laboratory reporting limit.

- **Bold/Shaded** cells indicate analyte concentration exceeded applicable criteria. EGLE Part 201 criteria exceeded is indicated by the footnote in [brackets] following the result value and defined below:

- |                                                                                |                                                                                    |

Evaluation based on EGLE Criteria at time of Project completion.

Samples described in this evaluation may actually refer to stamp sands or to other mining waste from the historic mining and reclamation processes conducted in the area.

- |                                  |                                                                                   |

Criteria Footnotes:

ID = Insufficient data to develop criterion.

NA = A criterion or value is not available

NLL = Hazardous substance is not likely to leach under most soil conditions.

(B) = Background, as defined in R 299.1(b), may be substituted if higher than the calculated cleanup criterion. Background levels may be less than criteria for some inorganic compounds.

(BB) = The state drinking water standard for asbestos (fibers greater than 10 micrometers in length) is in units of a million fibers per liter of water (MFL). Soil concentrations of asbestos are determined by polarized light microscop.

(C) = The criterion developed under R 299.20 to R 299.26 exceeds the chemical- specific soil saturation screening level (Csat). The person proposing or implementing response activity shall document whether additional response activity is required to control free-phase liquids or NAPL to protect against risks associated with free-phase liquids by using methods appropriate for the free-phase liquids present. Development of a site-specific Csat or methods presented in R 299.22, R 299.24(5), and R 299.26(8) may be conducted for the relevant exposure pathways.

(D) = Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).

(DD) = Hazardous substance causes developmental effects. Residential direct contact criteria are protective of both prenatal and postnatal exposure. Nonresidential direct contact criteria are protective for a pregnant adult receptor.

(F) = Criterion is based on adverse impacts to plant life and phytotoxicity.

(G) = Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. Where water hardness exceeds 400 mg Ca/L, use 400 mg CaCO<sub>3</sub>/L for the FCV calculation. The FCV formula provides values in units of ug/L or ppb.

The generic GSI criterion is the lesser of the calculated FCV, the wildlife value (WV), and the surface water human non-drinking water value (HNDV). The soil GSI protection criteria for these hazardous substances are the greater of the 20 times the GSI criterion or the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote. A spreadsheet that may be used to calculate GSI and GSI protection criteria for (G)-footnoted hazardous substances is available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. A hardness value of 47.5 CaCO<sub>3</sub>/L and pH of 7, derived from the Michigan Department of Environmental Quality Draft Site Inspection Report for Lake Linden Operations dated 3/29/13, was used in the footnote G calculation spreadsheet.

(H) = Valence-specific chromium data (Cr III and Cr VI) shall be compared to the corresponding valence-specific cleanup criteria. If both Cr III and Cr VI are present in groundwater, the total concentration of both cannot exceed the drinking water criterion of 100 ug/L. If analytical data are provided for total chromium only, they shall be compared to the cleanup criteria for Cr VI. Cr III soil cleanup criterion for protection of drinking water can only be used at sites where groundwater is prevented from being used as a public water supply, currently and in the future, through an approved land or resource use restriction.

(I) = Hazardous substance may exhibit the characteristic of ignitability as defined in 40 C.F.R. §261.21 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, Remediation and Redevelopment Division (RRD), 525 West Allegan Street, Lansing, Michigan 48933, at cost.

(J) = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations shall be added together for comparison to criteria.

(M) = Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.

(P) = Amenable cyanide methods or method OIA-1677 shall be used to quantify cyanide concentrations for compliance with all groundwater criteria. Total cyanide methods or method OIA-1677 shall be used to quantify cyanide concentrations for compliance with soil criteria. Nonresidential direct contact criteria may not be protective of the potential for release of hydrogen cyanide gas. Additional land or resource use restrictions may be necessary to protect for the acute inhalation concerns associated with hydrogen cyanide gas.

(Q) = Criteria for carcinogenic polycyclic aromatic hydrocarbons were developed using relative potential potencies to benzo(a)pyrene.

(R) = Hazardous substance may exhibit the characteristic of reactivity as defined in 40 C.F.R. §261.23 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost.

(T) = Refer to the federal Toxic Substances Control Act (TSCA), 40 C.F.R. §761, Subpart D and 40 C.F.R. §761, Subpart G, to determine the applicability of TSCA cleanup standards. Subpart D and Subpart G of 40 C.F.R. §761 (July 1, 2001) are adopted by reference in these rules and are available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulations may be purchased, at a cost as of the time of adoption of these rules of \$55, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401, or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost. Alternatives to compliance with the TSCA standards listed below are possible under 40 C.F.R. §761 Subpart D. New releases may be subject to the standards identified in 40 C.F.R. §761, Subpart G. Use Part 201 soil direct contact cleanup criteria in the published table if TSCA standards are not applicable.

(X) = The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information.)

(Z) = Mercury is typically measured as total mercury. The generic cleanup criteria, however, are based on data for different species of mercury. Specifically, data for elemental mercury, chemical abstract service (CAS) number 7439976, serve as the basis for the soil volatilization to indoor air criteria, groundwater volatilization to indoor air, and soil inhalation criteria. Data for methyl mercury, CAS number 22967926, serve as the basis for the GSI criterion; and data for mercuric chloride, CAS number 7487947, serve as the basis for the drinking water, groundwater contact, soil direct contact, and the groundwater protection criteria. Comparison to criteria shall be based on species-specific analytical data only if sufficient facility characterization has been conducted to rule out the presence of other species of mercury.

MSSL Footnotes:

J = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations must be added together for comparison to screening level.

JT = Hazardous substance may be present in several isomer forms. Screening levels may be used for the individual isomer provided that it is the sole isomer detected; however, when multiple isomers are detected in a medium, the isomer-specific concentrations must be added together and compared to the most restrictive screening level of the detected isomers.

M = The screening level may be below target detection limits (TDL).

Laboratory Footnotes:

J = The result is an estimated quantity.

U = Analyte analyzed for but not detected above the reported sample reporting limit.

UU = Analyte analyzed for but not detected above the reported sample reporting limit and is an estimated quantity.

## 11. DETAILED FINDINGS – AREA K

This Section summarizes applicable information available for Area K within QMCP derived from implementation of the SAP. The narrative follows the systematic investigative approach outlined in **Section 3**, while providing specific details about the potential human health and ecological risks associated with the historical mining operations in the subarea of QMCP.

### 11.1 SITE INSPECTION AND INVESTIGATION RESULTS

The implementation of the site inspection and investigation activities provided critical lines of evidence that link the historical documentation and the current environmental conditions in and around the Portage Canal. The following subsections present the findings of the inspection and investigation activities and provide correlation of mining era operations and their potential impacts on the nearshore and offshore environment of the Portage Canal.

#### 11.1.1 Site Inspection

The site inspection at each subarea included the inventory and locating of historical structures and similar surficial artifacts associated with the former industrial operations in the area. Each subarea was also inspected for potential physical and health hazards that were documented, photographed, and located with a GPS unit. The inventoried hazards were then qualitatively assessed for potential human health and environmental risks to determine if analytical sampling was warranted during the targeted inspection phase of the work.

On September 27, 2018, MSG field team personnel performed reconnaissance activities at Area K. In the cases where access was not requested based on historic operational and investigative findings, property conditions were evaluated from a neighboring property or public right of way where access was permitted. Access to Area K was not requested based on historic operational and investigative findings.

Therefore, the property parcel known as the Bayside Condominium Complex totaling approximately 26 acres was visually inspected and observations were recorded from the public road right of way. The following provides a summary of the findings associated with the reconnaissance activities. A copy of the reconnaissance log is provided in **Appendix C, Site Inspections – Reconnaissance Logs, Targeted Inspections & Physical Hazards Inventory**.

##### 11.1.1.1 Reconnaissance

The reconnaissance activities did not identify potentially abandoned containers or other environmental concerns. The qualitative assessment of the reconnaissance findings in Area K did not warrant the performance of limited targeted inspection activities.

#### 11.1.2 Site Investigation

Area K was not sampled nor was historic sampling data available as part of the SI report. Other environmental concerns, including those within the MDNR trail property, have been addressed and/or mitigated through interim responses undertaken by prior owners and further investigation as part of QMCP did not occur.

## 12. DETAILED FINDINGS – AREA M

This Section summarizes the results and the subsequent findings for Area M within QMCP derived from implementation of the SAP. The narrative follows the systematic investigative approach outlined in **Section 3**, while providing specific details about the potential human health and ecological risks associated with the historical mining operations in this subarea of QMCP.

### 12.1 SITE INSPECTION AND INVESTIGATION RESULTS

The implementation of the site inspection and investigation activities provided critical lines of evidence that link the historical documentation and the current environmental conditions in and around the Portage Canal. The following subsections present the findings of the inspection and investigation activities and provide correlation of mining era operations and their potential impacts on the nearshore and offshore environment of the Portage Canal.

#### 12.1.1 Site Inspection

The site inspection at each subarea included the inventory and locating of historical structures and similar surficial artifacts associated with the former industrial operations in the area. Each subarea was also inspected for potential physical and health hazards that were documented, photographed, and located with a GPS unit. The inventoried hazards were then qualitatively assessed for potential human health and environmental risks to determine if analytical sampling was warranted during the targeted inspection phase of the work.

On September 26, 2018, MSG field team personnel performed reconnaissance activities at Area M. The property parcel known as the Dollar Bay Well Field totaling approximately 15 acres was visually inspected and observations were recorded while traversing the property. The qualitative assessment of the reconnaissance findings in Area M warranted the performance of limited targeted inspection activities. The following provides a summary of the findings associated with the reconnaissance activities. A copy of the reconnaissance is provided in **Appendix C, Site Inspections – Reconnaissance Logs, Targeted Inspections & Physical Hazards Inventory**.

##### 12.1.1.1 Reconnaissance

The reconnaissance activities identified two fire extinguishers, several rusted and crushed and/or empty drum carcasses, and roofing material that was SACM.

##### 12.1.1.2 Targeted Inspection

The qualitative assessment of the reconnaissance findings in Area M warranted the performance of limited targeted inspection activities. Bulk material samples for asbestos analysis were collected on October 1, 2018 by a MSG field team. The following subsections summarize the findings of these sampling efforts.

##### 12.1.1.2.1 Bulk Material Sampling

Based on the SACM hazards noted during the reconnaissance activities a limited asbestos survey was conducted as part of the SI to identify suspect potentially friable ACM. The asbestos survey was limited to SACMs in open areas of the properties, and within debris piles.

Two bulk samples were collected from one SACM as part of the SI. Laboratory analysis indicated that neither of the material samples contained greater than 1% asbestos. SACM identified within Area M included roofing where trash appeared to have been dumped.

The samples were analyzed in accordance with EPA Method 600/R-93/116, “Method for the Determination of Asbestos in Bulk Building Materials” using Polarized Light Microscopy (PLM). This laboratory analytical method identifies the presence and estimated concentration of asbestos fibers in sampled building materials. The location of the bulk asbestos sampling location during the targeted inspection activities is depicted on **Figure 12-1, ACM Analytical Results (Area M)**. A detailed summary of bulk asbestos sample analytical results collected from Area M during the targeted inspection are provided in **Table 12-1, Summary of ACM Analytical Results (Area M)**.

## 12.1.2 Site Investigation

The SI in the QMCP was developed based on a variety of data and information as outlined in **Section 3**. In addition to the historical accounts and documentation, current land use and potential exposure pathways were also taken into consideration when selecting the sampling locations specific to Area M. The following subsections present the outcomes of investigative activities completed in Area M by summarizing the laboratory analytical results and characterizing their impacts on the environmental media in which they were detected.

### 12.1.2.1 Terrestrial Investigation

Intrusive investigation activities in Area M were generally guided by the findings of historical research and field observations. From a historical standpoint, the area was the location of operations subject to or associated with historic mining practices of the Lake Superior Smelting Co. and is currently the location of the Dollar Bay Well Field.

COCs in the study area were not generally understood and previous investigative activities did not fully characterize or address organic and inorganic contaminants in soil and groundwater. The following subsections present a summary of the field observations and analytical results derived from the terrestrial sampling activities.

#### 12.1.2.1.1 Field Observations – Soil and Groundwater

Borings within Area M were advanced by GSS to depths between 9 and 16 ft bgs. Boring locations are depicted on **Figure 12-2, Soil Analytical Results (Area M)**. Soil observations documented on field logs indicate that the subsurface of Area M is generally comprised of fine to medium brown sand at locations along the shoreline (SB-37 and SB-38). Fine to medium-coarse gray sand transitioning to fine to coarse brown sands at approximately 2 ft bgs were observed at soil boring locations within the central and eastern portions of the property.

During groundwater sampling, temporary well points were generally established at 4 ft intervals ranging from 9 ft to 16 ft bgs to the bottom of the screened interval. Saturated soil conditions were generally encountered between depths of 5 ft and 12 ft bgs. Groundwater quality parameters, including temperature, conductivity, DO, and pH, measured at the time of sample collection were generally considered normal.

#### 12.1.2.1.2 Soil Sampling Results

Terrestrial soil investigation activities were completed at Area M between September 6 and 11, 2018. During the mobilization a total of 20 soil samples including one duplicate soil sample were collected from 11 locations. Soil sample locations are depicted on **Figure 12-2, Soil Analytical Results (Area M)**. Investigative methodologies and soil sampling techniques were conducted using the procedures outlined in **Section 3**.

Soil sampling included 11 shallow soil locations, generally from 0 to 6 inches in depth with the balance of the locations advanced for collection of subsurface soil samples ranging from 0.5 ft to 12 ft in depth. The samples were analyzed for the parameters identified on **Table 3-1, Sampling and Analysis Summary** of this SI Report. The selection of analytical parameters was generally based upon potential environmental impacts associated with mining era operations in the vicinity of the sampling location or field observations.

The shallow surface and subsurface soil analytical results for Area M contained several COCs at concentrations at or above applicable regulatory criteria.

A detailed summary of soil analytical results collected from Area M is provided in **Table 12-2, Summary of Soil Analytical Results (Area M)**. Soil boring logs are included in **Appendix E, Boring Logs** of this SI Report.

#### 12.1.2.1.3 Groundwater Sampling Results

During the installation of soil borings at Area M, six (6) temporary groundwater sampling locations were established to characterize groundwater in the area. The temporary sampling points were installed and sampled using the methodologies presented in **Section 3**. The screened intervals at the groundwater sampling locations were established ranging from 5 ft to 9 ft bgs to 12 ft to 16 ft bgs. A total of six (6) groundwater samples were collected. Temporary groundwater and existing monitoring well sampling locations are depicted on **Figure 12-3, Groundwater Analytical Results (Area M)**.

Collected groundwater samples were analyzed for the parameters identified on **Table 3-1, Sampling and Analysis Summary** of this SI Report. The selection of analytical parameters was generally based upon potential environmental impacts associated with mining era operations in the vicinity of the sampling location or field observations. PCBs were not detected in groundwater at Area M nor were any other COCs detected in groundwater above applicable criteria with the exception of metals, which were not evaluated further as discussed in **Section 4.2.5**.

A detailed summary of groundwater analytical results collected from Area M is provided in **Table 12-3, Summary of Groundwater Analytical Results (Area M)**. Groundwater analytical results are depicted on **Figure 12-3, Groundwater Analytical Results (Area M)**. Soil boring logs are included in **Appendix E, Boring Logs** of this SI Report.

## 12.2 NATURE AND EXTENT OF CONTAMINATION

Utilizing the established regulatory criteria presented in **Section 4** for various land use categories and exposure pathways, the laboratory analytical results summarized in the preceding section for Area M were reviewed and compared to EGLE Cleanup Criteria Requirements for Response Activity as applicable for the sampled environmental media.

### 12.2.1 Comprehensive Exposure Assessment

The comparison was completed to determine which ecological and human exposure pathways, risks, and conditions are relevant at Area M. Although not inclusive of relevant pathways where regulatory criteria were not exceeded, the following exposure pathways were determined to be relevant in Area M:

- Risks posed by hazardous substances in soil and the potential for the substances to leach to groundwater that could vent to surface water.
- Risks posed by hazardous substances in soil and the potential for direct contact with these soils in both residential and nonresidential settings.

As discussed in **Section 4.2.5**, EGLE drinking water and groundwater/surface water pathway criteria exceedances for metals were excluded from the soil and groundwater evaluation. The rationale for this exclusion is twofold:

- The Project investigation and anticipated response actions are being undertaken pursuant to Part 201 of NREPA, being PA 451 of 1994, as amended. The concentrations of metals in excess of the EGLE drinking water and groundwater/surface water pathway criteria are ubiquitous in the study area and are predominantly the result of the presence of stamp sands. Stamp sands are not defined as a hazardous substance nor are subject to regulation under Part 201 unless the property otherwise contains hazardous substances in excess of concentrations that satisfy the cleanup criteria for unrestricted residential use; and,
- The study area is part of OU 2 for which the EPA ROD remedy called for No Action. The EPA's ROD OU 2 includes groundwater, surface water, submerged tailings and sediments in Torch Lake, Portage Lake, the Portage Canal, and other area water bodies. Note that EPA's No Action determination relies on the following to mitigate the effects of stamp sand to the extent practicable:
  - The reduction of stamp sand loading to surface water bodies expected as a result of the remedial action taken at OU 1 and OU 3.
  - Ongoing natural sedimentation and detoxification.
  - Institutional programs and practices controlling potential future exposure to site-affected drinking water which were intended to be administered at the county and state level.
  - The long-term monitoring and the five-year review process monitoring requirements of the remedy selected for OU 1 and OU 3 under the 1992 ROD.

Note that metals criteria for other relevant pathways, and cyanide and organic contaminants for all pathways were included in the evaluation.

Furthermore, as discussed in **Section 4.2.5**, EGLE's MSSSLs were not included in the exposure pathway assessment due to unknown anticipated future land use and conditions. The MSSSLs were considered for screening and delineation purposes only.

#### *12.2.1.1 Building Materials and Containers*

During the targeted inspection activities completed at Area M, one SACM was identified and samples were collected from the building (roofing) materials.

The following table provides an aggregate summary of the sample locations with respect to the total number of samples and how they compare to applicable regulatory criteria. The table is based solely on the total number of samples, inclusive of historical samples, collected from Area M. It lists only the number of samples for a specific analytical suite that contained one or more exceedance of a given criterion. Bulk asbestos samples were compared to applicable NESHAP standards and EGLE PSIC.

| Building Materials Analytical Result Summary Table                  | Analytical Summary      |                   |                   | National Emissions Standard for Hazardous Air Pollutants |                               |
|---------------------------------------------------------------------|-------------------------|-------------------|-------------------|----------------------------------------------------------|-------------------------------|
|                                                                     | Total Number of Samples | Detected Analytes | Total Exceedances | Friable Asbestos Material                                | Non-Friable Asbestos Material |
| Asbestos (Bulk)                                                     | 2                       | 0                 | 0                 | 0                                                        | 0                             |
| COCs exceeding applicable regulatory criteria in one or more sample |                         |                   |                   | Not applicable                                           |                               |

During the targeted inspection activities completed at Area M, four total drums were identified; however, none were sampled due to the nature of their contents. Most appeared to be empty or were observed to be drum carcasses.

#### 12.2.1.2 Soil Exposure Pathway Assessment

Soil analytical results from Area M identified COC concentrations in soil that were at or above concentrations that trigger a “Facility” designation as defined in Section 20101(1)(s) of the NREPA. The following tables provide an aggregate summary of the soil sample locations with respect to the total number of samples and how they compare to the applicable EGLE Cleanup Criteria for Response Activity under both Residential and Nonresidential exposure scenarios. The tables are based solely on the total number of samples, inclusive of historical samples, collected from Area M. They list only the number of samples for a specific analytical suite that contained one or more exceedance of a given criterion.

| Soil Analytical Result Summary Table                                 | Cleanup Criteria Requirements for Response Activity – Residential** |                    |                    |                                                                                                    |                                                         |                                                       |                                                          |                                          |                                          |                                      |                         |                                                |

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the groundwater evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSLS or non-applicable criteria (DWPC and GSIPC for metals).

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the groundwater evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSLS or non-applicable criteria (DWPC and GSIPC for metals).

### 12.2.1.3 Groundwater Exposure Pathway Assessment

Groundwater analytical results from Area M did not identify COC concentrations in groundwater that were at or above concentrations that trigger a “Facility” designation as defined in Section 20101(1)(s) of the NREPA. Similar to the preceding soil tables, the following table provides a summary of the aforementioned sample locations with respect to the total number of samples and how they compare to the applicable EGLE Cleanup Criteria for Response Activity under both Residential and Nonresidential exposure scenarios.

| Groundwater Analytical Result Summary Table                          | Analytical Summary      |                                    |                    | Cleanup Criteria Requirements for Response Activity – Residential and Nonresidential** |                                        |                                              |                                                                          |                                                                             |                  |                                               |

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the groundwater evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.

Total exceedance column does not include MSSLS or non-applicable criteria (DWC and GSIC for metals).

## 12.2.2 Extent of Contamination

The comparison of analytical results to applicable regulatory criteria indicates that potential human health and ecological risks are present in soil in Area M. Recalling the goals and objectives of the SI, the following subsections describe the extent of contamination in environmental media in the study area.

### 12.2.2.1 Building Materials and Containers Extent of Contamination

Reconnaissance activities and asbestos analytical results for the sampled roofing material did not confirm that ACM is present in Area M.

### 12.2.2.2 Soil Extent of Contamination

Soil analytical results exceeded GSIPC, and both DCC and MSSLS in residential and nonresidential exposure scenarios within Area M. The predominant contaminants were VOCs, SVOCs, and inorganic compounds, with arsenic exceeding residential and/or nonresidential DCC at seven locations. VOC concentrations exceeding GSIPC and residential/nonresidential MSSLS, and SVOC concentrations exceeding GSIPC were detected in samples collected from both near historic mining building foundations (SB39 and SS26) and along the eastern property boundary (SB41 and SB42).

Most samples were collected from surface and subsurface soil intervals from areas that are generally accessible to the public despite being private or municipally-owned properties. The sampling locations were within approximately 50 ft to 800 ft of the shoreline of the Portage Canal.

The extent of contaminated soil has not been delineated within Area M. Soils with elevated levels of inorganic COCs are ubiquitous in the area, which becomes a limiting factor when evaluating potential exposure pathways. In the case of Area M, elevated concentrations of inorganic and VOC contaminants potentially include exposure risks related to inhalation and dermal contact pathways, which must be a consideration when evaluating land use, property accessibility, and the extent of contamination in surface and near surface soils that could be encountered through normal use of the property.

The remaining exposure risks are generally related to the leaching of contaminants to groundwater and their potential impacts on surface water. These risks pose a long-term threat to the overall environmental health of the watershed. The widespread distribution of inorganic COCs throughout the region limit determinations related to the extent of metals contamination in Area M. Nevertheless, risks are posed to groundwater and surface water and are a factor when evaluating the extent of soil contamination in Area M.

#### 12.2.2.3 *Groundwater Extent of Contamination*

Groundwater analytical results did not exceed applicable criteria for organic or inorganic contaminants throughout the investigated area, with the exception of metals, which were not evaluated further as discussed in **Section 4.2.5**.

No other analyzed constituents were detected above criteria within Area M. The groundwater sampling locations were established in a zone roughly 50 ft to 800 ft from the shoreline of the Portage Canal.

The potential risks associated with groundwater as a drinking water source as well as its connectivity to nearby surface water bodies should be a consideration in determinations related to the extent of contamination in Area M.

### 12.3 **CONCLUSIONS AND RECOMMENDATIONS**

The analytical results and interpretation summarized in the preceding subsections document potential human health and ecological risks that are present in Area M. The following subsections provide a synopsis of these findings and a recommended path forward for mitigating these risks in Area M.

#### 12.3.1 **Conclusions**

Environmental impacts in Area M are generally characterized by detections of organic and inorganic contaminants in soil. Although specific sources of these contaminants may not be fully understood, historical research related to the operations provided substantive evidence for assessing specific operational areas and selecting target analytes anticipated to be present within the study area.

The analytical results from the SI activities summarized above provide sufficient analytical data and lines of evidence to conclude that the study area is a "Facility" as defined in Section 20101(1)(s) of the NREPA. The following table provides a summary of the affected environmental media, applicable regulatory criteria, and potential receptors within Area M.

| Area M – Media, Criteria, Potential Receptor Summary                |                           |                                     |                |                                                                                                    |                                     |                              |                |                        |            |               |              |                                                        |                              |               |

In addition to the evaluation of analytical results from Area M, the following provides a summary of findings derived from the assessment of Area M with respect to the goals and objectives for the Project:

- Terrestrial sources of contamination are present in the form of inorganic COCs, VOCs, and SVOCs in the study area. The extent of contamination in Area M has not been fully defined or addressed.
- Arsenic concentrations in surface soils at Area M exceed DCC for residential and nonresidential scenarios, potentially leading to unacceptable exposures for users of the property.

### 12.3.2 Recommendations

The conclusions outlined in the preceding subsection establish that Area M is a Part 201 Facility. Section 20107a of Part 201 of NREPA describes the duties of owners or operators of a Facility, regardless of their liability, including: prevent unacceptable exposures, prevent exacerbation, and take reasonable precautions against the foreseeable actions of third parties. Some exceptions may apply; in any case, owners and operators of contaminated properties should become familiar with Section 20107a and the associated Rules.

Note: Analytical and Criteria Footnotes are included on the last page of the table.

TABLE 12-2  
Summary of Soil Analytical Results  
Area M  
Quincy Mining Company Portage Operations Area  
Abandoned Mining Wastes - Torch Lake Non-Superfund Site

Soil Table Footnotes:

- EGLE Part 201 residential and non-residential generic cleanup criteria and screening levels criteria were originally promulgated December 21, 2002 within the Administrative Rules for Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. This table reflects revisions to the criteria pursuant to the December 2010 Part 201 amendments and new criteria consistent with the provisions of R299.5706a. Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. Release Date: December 30, 2013. Updated June 2018.

- Only detected analytes are listed - Gray rows indicate requested analyses. If no analytes are listed below a gray row then all analytes of that group were either not analyzed or not detected.

- **Bold** values are concentrations detected above the laboratory reporting limit.

- **Bold/Shaded** cells indicate analyte concentration exceeded applicable criteria. EGLE Part 201 criteria exceeded is indicated by the footnote in [brackets] following the result value and defined below:

- |                                                                                |                                                                                    |

Evaluation based on EGLE Criteria at time of Project completion.

Samples described in this evaluation may actually refer to stamp sands or to other mining waste from the historic mining and reclamation processes conducted in the area.

-- = No Exceedances

NM = Not Measured

ND = Not Detected

bgs = Below ground surface

ft = Feet

in = Inches

mg/kg = Milligrams per kilogram.

PCBs = Polychlorinated biphenyls

VOC = Volatile organic compound

SVOC = Semi-volatile organic compound

MSSL = Media-Specific Volatilization to Indoor Air Interim Action Screening Level

ug/kg = Micrograms per kilogram

% = Percentage

Criteria Footnotes:

ID = Insufficient data to develop criterion.

NA = A criterion or value is not available

NLL = Hazardous substance is not likely to leach under most soil conditions.

(B) = Background, as defined in R 299.1(b), may be substituted if higher than the calculated cleanup criterion. Background levels may be less than criteria for some inorganic compounds.

(BB) = The state drinking water standard for asbestos (fibers greater than 10 micrometers in length) is in units of a million fibers per liter of water (MFL). Soil concentrations of asbestos are determined by polarized light microscop.

(C) = The criterion developed under R 299.20 to R 299.26 exceeds the chemical- specific soil saturation screening level (Csat). The person proposing or implementing response activity shall document whether additional response activity is required to control free-phase liquids or NAPL to protect against risks associated with free-phase liquids by using methods appropriate for the free-phase liquids present. Development of a site-specific Csat or methods presented in R 299.22, R 299.24(5), and R 299.26(8) may be conducted for the relevant exposure pathways.

(D) = Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).

(DD) = Hazardous substance causes developmental effects. Residential direct contact criteria are protective of both prenatal and postnatal exposure. Nonresidential direct contact criteria are protective for a pregnant adult receptor.

(F) = Criterion is based on adverse impacts to plant life and phytotoxicity.

(G) = Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. Where water hardness exceeds 400 mg Ca<sub>4</sub>/L, use 400 mg CaCO<sub>3</sub>/L for the FCV calculation. The FCV formula provides values in units of ug/L or ppb.

The generic GSI criterion is the lesser of the calculated FCV, the wildlife value (WV), and the surface water human non-drinking water value (HNDV). The soil GSI protection criteria for these hazardous substances are the greater of the 20 times the GSI criterion or the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote. A spreadsheet that may be used to calculate GSI and GSI protection criteria for (G)-footnoted hazardous substances is available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. A hardness value of 47.5 CaCO<sub>3</sub>L and pH of 7, derived from the Michigan Department of Environmental Quality Draft Site Inspection Report for Lake Linden Operations dated 3/29/13, was used in the footnote G calculation spreadsheet.

(H) = Valence-specific chromium data (Cr III and Cr VI) shall be compared to the corresponding valence-specific cleanup criteria. If both Cr III and Cr VI are present in groundwater, the total concentration of both cannot exceed the drinking water criterion of 100 ug/L. If analytical data are provided for total chromium only, they shall be compared to the cleanup criteria for Cr VI. Cr III soil cleanup criterion for protection of drinking water can only be used at sites where groundwater is prevented from being used as a public water supply, currently and in the future, through an approved land or resource use restriction.

(I) = Hazardous substance may exhibit the characteristic of ignitability as defined in 40 C.F.R. §261.21 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, Remediation and Redevelopment Division (RRD), 525 West Allegan Street, Lansing, Michigan 48933, at cost.

(J) = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations shall be added together for comparison to criteria.

(M) = Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.

(P) = Amenable cyanide methods or method OIA-1677 shall be used to quantify cyanide concentrations for compliance with all groundwater criteria. Total cyanide methods or method OIA-1677 shall be used to quantify cyanide concentrations for compliance with soil criteria. Nonresidential direct contact criteria may not be protective of the potential for release of hydrogen cyanide gas. Additional land or resource use restrictions may be necessary to protect for the acute inhalation concerns associated with hydrogen cyanide gas.

(Q) = Criteria for carcinogenic polycyclic aromatic hydrocarbons were developed using relative potential potencies to benzo(a)pyrene.

(R) = Hazardous substance may exhibit the characteristic of reactivity as defined in 40 C.F.R. §261.23 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost.

(T) = Refer to the federal Toxic Substances Control Act (TSCA), 40 C.F.R. §761, Subpart D and 40 C.F.R. §761, Subpart G, to determine the applicability of TSCA cleanup standards. Subpart D and Subpart G of 40 C.F.R. §761 (July 1, 2001) are adopted by reference in these rules and are available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulations may be purchased, at a cost as of the time of adoption of these rules of \$55, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401, or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost. Alternatives to compliance with the TSCA standards listed below are possible under 40 C.F.R. §761 Subpart D. New releases may be subject to the standards identified in 40 C.F.R. §761, Subpart G. Use Part 201 soil direct contact cleanup criteria in the published table if TSCA standards are not applicable.

(X) = The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information.)

(Z) = Mercury is typically measured as total mercury. The generic cleanup criteria, however, are based on data for different species of mercury. Specifically, data for elemental mercury, chemical abstract service (CAS) number 7439976, serve as the basis for the soil volatilization to indoor air criteria, groundwater volatilization to indoor air, and soil inhalation criteria. Data for methyl mercury, CAS number 22967926, serve as the basis for the GSI criterion; and data for mercuric chloride, CAS number 7487947, serve as the basis for the drinking water, groundwater contact, soil direct contact, and the groundwater protection criteria. Comparison to criteria shall be based on species-specific analytical data only if sufficient facility characterization has been conducted to rule out the presence of other species of mercury.

MSSL Footnotes:

J = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations must be added together for comparison to screening level.

JT = Hazardous substance may be present in several isomer forms. Screening levels may be used for the individual isomer provided that it is the sole isomer detected; however, when multiple isomers are detected in a medium, the isomer-specific concentrations must be added together and compared to the most restrictive screening level of the detected isomers.

M = The screening level may be below target detection limits (TDL).

Laboratory Footnotes:

J = The result is an estimated quantity.

U = Analyte analyzed for but not detected above the reported sample reporting limit.

UU = Analyte analyzed for but not detected above the reported sample reporting limit and is an estimated quantity.

Note: Analytical and Criteria Footnotes are included on the last page of the table.

TABLE 12-3  
Summary of Groundwater Analytical Results  
Area M  
Quincy Mining Company Portage Operations Area  
Abandoned Mining Wastes - Torch Lake Non-Superfund Site

Groundwater Table Footnotes:

- EGLE Part 201 residential and non-residential generic cleanup criteria and screening levels criteria were originally promulgated December 21, 2002 within the Administrative Rules for Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. This table reflects revisions to the criteria pursuant to the December 2010 Part 201 amendments and new criteria consistent with the provisions of R299.5706a. Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. Release Date: December 30, 2013. Updated December 21, 2020.

- Only detected analytes are listed - Gray rows indicate requested analyses. If no analytes are listed below a gray row then all analytes of that group were either not analyzed or not detected.

- **Bold** values are concentrations detected above the laboratory reporting limit.

- **Bold/Shaded** cells indicate analyte concentration exceeded applicable criteria. EGLE Part 201 criteria exceeded is indicated by the footnote in [brackets] following the result value and defined below:

|                                                                                   |                                                    |
|-----------------------------------------------------------------------------------|----------------------------------------------------|
| [1] - Residential Drinking Water Criteria                                         | [8] Shallow Groundwater Residential MSSL           |
| [2] - Nonresidential Drinking Water Criteria                                      | [9] Shallow Groundwater Nonresidential MSSL        |
| [3] - Groundwater Surface Water Interface Criteria                                | [10] Groundwater Residential MSSL                  |
| [4] - Water Solubility                                                            | [11] Groundwater Residential TS MSSL               |
| [5] - Residential Groundwater Volatilization to Indoor Air Inhalation Criteria    | [12] Groundwater Nonresidential MSSL               |
| [6] - Nonresidential Groundwater Volatilization to Indoor Air Inhalation Criteria | [13] Groundwater Nonresidential MSSL <sub>12</sub> |
| [7] - Flammability and Explosivity Screening Level                                | [14] Groundwater Nonresidential TS MSSL            |

Evaluation based on EGLE Criteria at time of Project completion.

Groundwater Table Footnotes:

ID = Insufficient data to develop criterion.

NA = A criterion or value is not available

NLV = Hazardous substance is not likely to volatilize under most conditions.

(A) = Criterion is the state of Michigan drinking water standard established pursuant to Section 5 of 1976 PA 399, MCL 325.1005.

(AA) = Use 10,000 ug/l where groundwater enters a structure through the use of a water well, sump or other device. Use 28,000 ug/l for all other uses.

(B) = Background, as defined in R 299.1(b), may be substituted if higher than the calculated cleanup criterion. Background levels may be less than criteria for some inorganic compounds.

(D) = Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).

(E) = Criterion is the aesthetic drinking water value, as required by Section 20120a(5) of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (NREPA). A notice of aesthetic impact may be employed as an institutional control mechanism if groundwater concentrations exceed the aesthetic drinking water criterion, but do not exceed the applicable health-based drinking water value provided in a table available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information)

(FF) = The chloride GSI criterion shall be 125 mg/l when the discharge is to surface waters of the state designated as public water supply sources or 50 mg/l when the discharge is to the Great Lakes or connecting waters. Chloride GSI criteria shall not apply for surface waters of the state that are not designated as a public water supply source, however, the total dissolved solids criterion is applicable.

(G) = Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. Where water hardness exceeds 400 mg CaCO<sub>3</sub>/L, use 400 mg CaCO<sub>3</sub>/L for the FCV calculation. The FCV formula provides values in units of ug/L or ppb. The generic GSI criterion is the lesser of the calculated FCV, the wildlife value (WV), and the surface water human non-drinking water value (HNDV). The soil GSI protection criteria for these hazardous substances are the greater of the 20 times the GSI criterion or the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote. A spreadsheet that may be used to calculate GSI and GSI protection criteria for (G)-footnoted hazardous substances is available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. A hardness value of 47.5 CaCO<sub>3</sub>/L and pH of 7, derived from the Michigan Department of Environmental Quality Draft Site Inspection Report for Lake Linden Operations dated 3/29/13, was used in the footnote G calculation spreadsheet.

(H) = Valence-specific chromium data (Cr III and Cr VI) shall be compared to the corresponding valence-specific cleanup criteria. If both Cr III and Cr VI are present in groundwater, the total concentration of both cannot exceed the drinking water criterion of 100 ug/L. If analytical data are provided for total chromium only, they shall be compared to the cleanup criteria for Cr VI. Cr III soil cleanup criterion for protection of drinking water can only be used at sites where groundwater is prevented from being used as a public water supply, currently and in the future, through an approved land or resource use restriction.

(HH) = The residential criterion for sodium is 230,000 ug/l in accordance with the Sodium Advisory Council recommendation and revised Groundwater Discharge Standards.

(I) = Hazardous substance may exhibit the characteristic of ignitability as defined in 40 C.F.R. §261.21 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, Remediation and Redevelopment Division (RRD), 525 West Allegan Street, Lansing, Michigan 48933, at cost.

(J) = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations shall be added together for comparison to criteria.

(L) = Criteria for lead are derived using a biologically based model, as allowed for under Section 20120a(9) of the NREPA, and are not calculated using the algorithms and assumptions specified in pathway-specific rules. The generic residential drinking water criterion of 4 ug/L is linked to the generic residential soil direct contact criterion of 400 mg/kg. A higher concentration in the drinking water, up to the state action level of 15 ug/L, may be allowed as a site-specific remedy and still allow for drinking water use, under Section 20120a(2) and 20120b of the NREPA if soil concentrations are appropriately lower than 400 mg/kg. If a site-specific criterion is approved based on this subdivision, a notice shall be filed on the deed for all property where the groundwater concentrations will exceed 4 ug/L to provide notice of the potential for unacceptable risk if soil or groundwater concentrations increase.

Acceptable combinations of site-specific soil and drinking water concentrations are presented in a table available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site (See R 299.49 Footnotes for generic cleanup criteria tables for additional information).

(M) = Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.

(Q) = Criteria for carcinogenic polycyclic aromatic hydrocarbons were developed using relative potential potencies to benzo(a)pyrene.

(S) = Criterion defaults to the hazardous substance-specific water solubility limit.

(T) = Refer to the federal Toxic Substances Control Act (TSCA), 40 C.F.R. §761, Subpart D and 40 C.F.R. §761, Subpart G, to determine the applicability of TSCA cleanup standards. Subpart D and Subpart G of 40 C.F.R. §761 (July 1, 2001) are adopted by reference in these rules and are available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulations may be purchased, at a cost as of the time of adoption of these rules of \$55, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401, or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost. Alternatives to compliance with the TSCA standards listed below are possible under 40 C.F.R. §761 Subpart D. New releases may be subject to the standards identified in 40 C.F.R. §761, Subpart G. Use Part 201 soil direct contact cleanup criteria in the published table if TSCA standards are not applicable.

(X) = The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information.)

(Z) = Mercury is typically measured as total mercury. The generic cleanup criteria, however, are based on data for different species of mercury. Specifically, data for elemental mercury, chemical abstract service (CAS) number 7439976, serve as the basis for the soil volatilization to indoor air criteria, groundwater volatilization to indoor air, and soil inhalation criteria. Data for methyl mercury, CAS number 22967926, serve as the basis for the GSI criterion; and data for mercuric chloride, CAS number 7487947, serve as the basis for the drinking water, groundwater contact, soil direct contact, and the groundwater protection criteria. Comparison to criteria shall be based on species-specific analytical data only if sufficient facility characterization has been conducted to rule out the presence of other species of mercury.

MSSL Footnotes:

GW = The calculated value for a hazardous substance based upon shallow groundwater is considered protective when it is greater than the calculated value for groundwater.

J = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations must be added together for comparison to screening level.

JT = Hazardous substance may be present in several isomer forms. Screening levels may be used for the individual isomer provided that it is the sole isomer detected; however, when multiple isomers are detected in a medium, the isomer-specific concentrations must be added together and compared to the most restrictive screening level of the detected isomers.

Laboratory Footnotes:

U = Analyte analyzed for but not detected above the reported sample reporting limit.

## 13. DETAILED FINDINGS – AREA O

This Section summarizes the results and subsequent findings for Area O within QMCP derived from implementation of the SAP. The narrative follows the systematic investigative approach outlined in **Section 3**, while providing specific details about the potential human health and ecological risks associated with the historical mining operations in the subarea of QMCP.

### 13.1 SITE INSPECTION AND INVESTIGATION RESULTS

The implementation of the site inspection and investigation activities provided critical lines of evidence that link the historical documentation and the current environmental conditions in and around the Portage Canal. The following subsections present the findings of the inspection and investigation activities and provide correlation of mining era operations and their potential impacts on the nearshore and offshore environment of the Portage Canal.

#### 13.1.1 Site Inspection

The site inspection at each subarea included the inventory and locating of historical structures and similar surficial artifacts associated with the former industrial operations in the area. Each subarea was also inspected for potential physical and health hazards that were documented, photographed, and located with a GPS unit. The inventoried hazards were then qualitatively assessed for potential human health and environmental risks to determine if analytical sampling was warranted during the targeted inspection phase of the work.

On September 27, 2018, MSG field team personnel performed reconnaissance activities at Area O. In the cases where access was not requested based on historic operational and investigative findings, property conditions were evaluated from a neighboring property or public right of way where access was permitted. Access to Area O was not requested based on historic operational and investigative findings.

Therefore, the property parcel known as Horner Flooring totaling approximately 30 acres was visually inspected and observations were recorded from the public road right of way. The following provides a summary of the findings associated with the reconnaissance activities. A copy of the reconnaissance log is provided in **Appendix C, Site Inspections – Reconnaissance Logs, Targeted Inspections & Physical Hazards Inventory**.

##### 13.1.1.1 Reconnaissance

The reconnaissance activities did not identify potentially abandoned containers or other environmental concerns. The qualitative assessment of the reconnaissance findings in Area O did not warrant the performance of limited targeted inspection activities.

#### 13.1.2 Site Investigation

The SI in the QMCP was developed based on a variety of data and information as outlined in **Section 3**. In addition to the historical accounts and documentation, current land use and potential exposure pathways were also taken into consideration when selecting sampling locations. Due to this, along with findings associated with previous investigations, SI activities were not conducted in Area O. The following subsections present the outcomes of historic investigative activities completed in Area O by summarizing the laboratory analytical results and characterizing their impacts on the environmental media in which they were detected.

#### 13.1.2.1 Historic Investigations

Intrusive investigation activities in the QMCP were generally guided by the findings of historical research and field observations. Following a review of available historic Sanborn Maps and other resources, historic land use and/or operations within Area O included Dollar Bay Land and Improvement Co., Dollar Bay Lumber Company, Dollar Bay Lumber Co. Saw Mill & Lumber Yard, and Horner Flooring Co. Wood Flooring Mill.

Potential organic and inorganic COCs in the study area were generally understood, particularly in areas where previous investigations and remedial actions had been completed. However, only limited data related to the COCs on the property was available. Previous investigative activities did not include soil sampling and did not fully characterize contaminants in groundwater.

A detailed summary of groundwater analytical results collected from Area O is provided in **Table 13-1, Summary of Groundwater Analytical Results (Area O)**. Historic groundwater analytical results are depicted on **Figure 13-1, Groundwater Analytical Results (Area O)**.

### 13.2 NATURE AND EXTENT OF CONTAMINATION

Utilizing the established regulatory criteria presented in **Section 4** for various land use categories and exposure pathways, the laboratory analytical results summarized in the preceding section for Area O were reviewed and compared to EGLE Cleanup Criteria Requirements for Response Activity as applicable for the sampled environmental media.

#### 13.2.1 Comprehensive Exposure Assessment

The comparison was completed to determine which ecological and human exposure pathways, risks, and conditions are relevant at Area O. Due to the limited nature of the available analytical data which only included analysis for pentachlorophenol in five groundwater samples in 1994, potentially relevant exposure pathways could not be fully evaluated.

As discussed in **Section 4.2.5**, EGLE drinking water and groundwater/surface water pathway criteria exceedances for metals were excluded from the soil and groundwater evaluation. The rationale for this exclusion is twofold:

- The Project investigation and anticipated response actions are being undertaken pursuant to Part 201 of NREPA, being PA 451 of 1994, as amended. The concentrations of metals in excess of the EGLE drinking water and groundwater/surface water pathway criteria are ubiquitous in the study area and are predominantly the result of the presence of stamp sands. Stamp sands are not defined as a hazardous substance nor are subject to regulation under Part 201 unless the property otherwise contains hazardous substances in excess of concentrations that satisfy the cleanup criteria for unrestricted residential use; and,
- The study area is part of OU 2 for which the EPA ROD remedy called for No Action. The EPA's ROD OU 2 includes groundwater, surface water, submerged tailings and sediments in Torch Lake, Portage Lake, the Portage Canal, and other area water bodies. Note that EPA's No Action determination relies on the following to mitigate the effects of stamp sand to the extent practicable:
  - The reduction of stamp sand loading to surface water bodies expected as a result of the remedial action taken at OU 1 and OU 3.
  - Ongoing natural sedimentation and detoxification.

- Institutional programs and practices controlling potential future exposure to site-affected drinking water which were intended to be administered at the county and state level.
- The long-term monitoring and the five-year review process monitoring requirements of the remedy selected for OU 1 and OU 3 under the 1992 ROD.

Note that metals criteria for other relevant pathways, and cyanide and organic contaminants for all pathways were included in the evaluation, if data was available.

Furthermore, as discussed in **Section 4.2.5**, EGLE's MSSLs were not included in the exposure pathway assessment due to unknown anticipated future land use and conditions. The MSSLs were considered for screening and delineation purposes only.

### 13.2.1.1 Groundwater Exposure Pathway Assessment

Groundwater analytical results from Area O did not detect COC concentrations in groundwater that were at or above concentrations that trigger a "Facility" designation as defined in Section 20101(1)(s) of the NREPA. However, as noted above, the only COC analyzed was pentachlorophenol. The following table provides a summary of the aforementioned sample locations with respect to the total number of samples and how they compare to the applicable EGLE Cleanup Criteria for Response Activity under both Residential and Nonresidential exposure scenarios.

| Groundwater Analytical Result Summary Table                          | Analytical Summary      |                                   |                   | Cleanup Criteria Requirements for Response Activity – Residential and Nonresidential |                                        |                                              |                                                                          |                                                                             |                  |                                               |

NA\* = The EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the groundwater evaluation as explained in Section 4.2.5.

\*Denotes total number of specific instances of an analyte being detected or exceeding criteria, can be multiple within one sample location.

*\*\*Denotes total number of samples exceeding criteria, cannot be multiple within one sample location.*

*Total exceedance column does not include MSSSLs or non-applicable criteria (DWC and GSIC for metals).*

#### 13.2.1.2 Groundwater Extent of Contamination

Groundwater analytical results did not exceed criteria in either residential or nonresidential exposure scenarios at Area O; however, limited historical analytical data related only to pentachlorophenol was available for evaluation. Additional information related to sampling was not available.

The groundwater sampling locations were established in a zone roughly 0 ft to 850 ft from the shoreline of Dollar Bay; however, depths were not available.

The potential risks associated with groundwater as a drinking water source as well as its connectivity to nearby surface water bodies should be a consideration if additional investigations are conducted related to potential contamination in Area O as the potential for exposure has not been fully investigated or evaluated.

### 13.3 CONCLUSIONS AND RECOMMENDATIONS

The analytical results and interpretation summarized in the preceding subsections document potential human health and ecological risks that are present in Area O. The following subsections provide a synopsis of these findings and a recommended path forward in Area O.

#### 13.3.1 Conclusions

Environmental impacts to soil and/or groundwater, if any, in the Area O have not been fully investigated or characterized. Based on available analytical data, specific sources of any potential contaminants may not be fully understood. However, historical research related to the operations provided substantive evidence for assessing specific operational areas and selecting target analytes anticipated to be present within the study area.

The historic analytical results summarized above do not provide sufficient analytical data and lines of evidence to conclude that the study area is a "Facility" as defined in Section 20101(1)(s) of the NREPA.

In addition to the evaluation of analytical results from Area O, the following provides a summary of findings derived from the assessment of Area O with respect to the goals and objectives for the Project:

- Terrestrial sources of contamination are not known to be present in the form of inorganic or organic COCs in the study area. Due to the nature of the analytical data, the extent of any potential contamination in Area O has not been fully defined or addressed.

#### 13.3.2 Recommendations

The conclusions outlined in the preceding subsection establish that Area O is not a Part 201 Facility based on existing available data. Section 20107a of Part 201 of NREPA describes the duties of owners or operators of a Facility, regardless of their liability, including: prevent unacceptable exposures, prevent exacerbation, and take reasonable precautions against the foreseeable actions of third parties. Some exceptions may apply; in any case, owners and operators of contaminated properties should become familiar with Section 20107a and the associated Rules.

Note: Analytical and Criteria Footnotes are included on the last page of the table.

TABLE 13-1  
Summary of Groundwater Analytical Results  
Area O  
Quincy Mining Company Portage Operations Area  
Abandoned Mining Wastes - Torch Lake Non-Superfund Site

Groundwater Table Footnotes:

- EGLE Part 201 residential and non-residential generic cleanup criteria and screening levels criteria were originally promulgated December 21, 2002 within the Administrative Rules for Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. This table reflects revisions to the criteria pursuant to the December 2010 Part 201 amendments and new criteria consistent with the provisions of R299.5706a. Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. Release Date: December 30, 2013. Updated December 21, 2020.

- Only detected analytes are listed - Gray rows indicate requested analyses. If no analytes are listed below a gray row then all analytes of that group were either not analyzed or not detected.

- **Bold** values are concentrations detected above the laboratory reporting limit.

- **Bold/Shaded** cells indicate analyte concentration exceeded applicable criteria. EGLE Part 201 criteria exceeded is indicated by the footnote in [brackets] following the result value and defined below:

|                                                                                   |                                                    |
|-----------------------------------------------------------------------------------|----------------------------------------------------|
| [1] - Residential Drinking Water Criteria                                         | [8] Shallow Groundwater Residential MSSL           |
| [2] - Nonresidential Drinking Water Criteria                                      | [9] Shallow Groundwater Nonresidential MSSL        |
| [3] - Groundwater Surface Water Interface Criteria                                | [10] Groundwater Residential MSSL                  |
| [4] - Water Solubility                                                            | [11] Groundwater Residential TS MSSL               |
| [5] - Residential Groundwater Volatilization to Indoor Air Inhalation Criteria    | [12] Groundwater Nonresidential MSSL               |
| [6] - Nonresidential Groundwater Volatilization to Indoor Air Inhalation Criteria | [13] Groundwater Nonresidential MSSL <sub>12</sub> |

Evaluation based on EGLE Criteria at time of Project completion.

|                                       |                                                                                                     |
|---------------------------------------|-----------------------------------------------------------------------------------------------------|
| -- = No Exceedances                   | mg/l = Milligrams per liter                                                                         |
| ND = Not Detected                     | °C = Degrees Celsius                                                                                |
| NM = Not Measured                     | mS/cm = MilliSiemens per centimeter                                                                 |
| bgs = Below ground surface            | % = Percentage                                                                                      |
| ft = Feet                             | nTu = Nephelometric Turbidity Unit                                                                  |
| PCBs = Polychlorinated biphenyls      | pH = pH acid-base scale                                                                             |
| SVOC = Semi-volatile organic compound | MSSL = Media-Specific Volatilization to Indoor Air Interim Action Screening Level                   |
| VOC = Volatile organic compound       | TS MSSL = Time Sensitive Media-Specific Volatilization to Indoor Air Interim Action Screening Level |

ug/l = Micrograms per liter

Groundwater Table Footnotes:

ID = Insufficient data to develop criterion.

NA = A criterion or value is not available

NLV = Hazardous substance is not likely to volatilize under most conditions.

(A) = Criterion is the state of Michigan drinking water standard established pursuant to Section 5 of 1976 PA 399, MCL 325.1005.

(AA) = Use 10,000 ug/l where groundwater enters a structure through the use of a water well, sump or other device. Use 28,000 ug/l for all other uses.

(B) = Background, as defined in R 299.1(b), may be substituted if higher than the calculated cleanup criterion. Background levels may be less than criteria for some inorganic compounds.

(D) = Calculated criterion exceeds 100 percent, hence it is reduced to 100 percent or 1.0E+9 parts per billion (ppb).

(E) = Criterion is the aesthetic drinking water value, as required by Section 20120a(5) of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (NREPA). A notice of aesthetic impact may be employed as an institutional control mechanism if groundwater concentrations exceed the aesthetic drinking water criterion, but do not exceed the applicable health-based drinking water value provided in a table available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information)

(FF) = The chloride GSI criterion shall be 125 mg/l when the discharge is to surface waters of the state designated as public water supply sources or 50 mg/l when the discharge is to the Great Lakes or connecting waters. Chloride GSI criteria shall not apply for surface waters of the state that are not designated as a public water supply source, however, the total dissolved solids criterion is applicable.

(G) = Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. Where water hardness exceeds 400 mg CaCO<sub>3</sub>/L, use 400 mg CaCO<sub>3</sub>/L for the FCV calculation. The FCV formula provides values in units of ug/L or ppb. The generic GSI criterion is the lesser of the calculated FCV, the wildlife value (WV), and the surface water human non-drinking water value (HNDV). The soil GSI protection criteria for these hazardous substances are the greater of the 20 times the GSI criterion or the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote. A spreadsheet that may be used to calculate GSI and GSI protection criteria for (G)-footnoted hazardous substances is available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site. A hardness value of 47.5 CaCO<sub>3</sub>/L and pH of 7, derived from the Michigan Department of Environmental Quality Draft Site Inspection Report for Lake Linden Operations dated 3/29/13, was used in the footnote G calculation spreadsheet.

(H) = Valence-specific chromium data (Cr III and Cr VI) shall be compared to the corresponding valence-specific cleanup criteria. If both Cr III and Cr VI are present in groundwater, the total concentration of both cannot exceed the drinking water criterion of 100 ug/L. If analytical data are provided for total chromium only, they shall be compared to the cleanup criteria for Cr VI. Cr III soil cleanup criterion for protection of drinking water can only be used at sites where groundwater is prevented from being used as a public water supply, currently and in the future, through an approved land or resource use restriction.

(HH) = The residential criterion for sodium is 230,000 ug/l in accordance with the Sodium Advisory Council recommendation and revised Groundwater Discharge Standards.

(I) = Hazardous substance may exhibit the characteristic of ignitability as defined in 40 C.F.R. §261.21 (revised as of July 1, 2001), which is adopted by reference in these rules and is available for inspection at EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulation may be purchased, at a cost as of the time of adoption of these rules of \$45, from the Superintendent of documents, Government Printing Office, Washington, DC 20401 (stock number 869-044-00155-1), or from the EGLE, Remediation and Redevelopment Division (RRD), 525 West Allegan Street, Lansing, Michigan 48933, at cost.

(J) = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations shall be added together for comparison to criteria.

(L) = Criteria for lead are derived using a biologically based model, as allowed for under Section 20120a(9) of the NREPA, and are not calculated using the algorithms and assumptions specified in pathway-specific rules. The generic residential drinking water criterion of 4 ug/L is linked to the generic residential soil direct contact criterion of 400 mg/kg. A higher concentration in the drinking water, up to the state action level of 15 ug/L, may be allowed as a site-specific remedy and still allow for drinking water use, under Section 20120a(2) and 20120b of the NREPA if soil concentrations are appropriately lower than 400 mg/kg. If a site-specific criterion is approved based on this subdivision, a notice shall be filed on the deed for all property where the groundwater concentrations will exceed 4 ug/L to provide notice of the potential for unacceptable risk if soil or groundwater concentrations increase.

Acceptable combinations of site-specific soil and drinking water concentrations are presented in a table available on the Department of Environment, Great Lakes, and Energy (EGLE) internet web site (See R 299.49 Footnotes for generic cleanup criteria tables for additional information).

(M) = Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.

(Q) = Criteria for carcinogenic polycyclic aromatic hydrocarbons were developed using relative potential potencies to benzo(a)pyrene.

(S) = Criterion defaults to the hazardous substance-specific water solubility limit.

(T) = Refer to the federal Toxic Substances Control Act (TSCA), 40 C.F.R. §761, Subpart D and 40 C.F.R. §761, Subpart G, to determine the applicability of TSCA cleanup standards. Subpart D and Subpart G of 40 C.F.R. §761 (July 1, 2001) are adopted by reference in these rules and are available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulations may be purchased, at a cost as of the time of adoption of these rules of \$55, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401, or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost. Alternatives to compliance with the TSCA standards listed below are possible under 40 C.F.R. §761 Subpart D. New releases may be subject to the standards identified in 40 C.F.R. §761, Subpart G. Use Part 201 soil direct contact cleanup criteria in the published table if TSCA standards are not applicable.

(X) = The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information.)

(Z) = Mercury is typically measured as total mercury. The generic cleanup criteria, however, are based on data for different species of mercury. Specifically, data for elemental mercury, chemical abstract service (CAS) number 7439976, serve as the basis for the soil volatilization to indoor air criteria, groundwater volatilization to indoor air, and soil inhalation criteria. Data for methyl mercury, CAS number 22967926, serve as the basis for the GSI criterion; and data for mercuric chloride, CAS number 7487947, serve as the basis for the drinking water, groundwater contact, soil direct contact, and the groundwater protection criteria. Comparison to criteria shall be based on species-specific analytical data only if sufficient facility characterization has been conducted to rule out the presence of other species of mercury.

MSSL Footnotes:

GW = The calculated value for a hazardous substance based upon shallow groundwater is considered protective when it is greater than the calculated value for groundwater.

J = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations must be added together for comparison to screening level.

JT = Hazardous substance may be present in several isomer forms. Screening levels may be used for the individual isomer provided that it is the sole isomer detected; however, when multiple isomers are detected in a medium, the isomer-specific concentrations must be added together and compared to the most restrictive screening level of the detected isomers.

Laboratory Footnotes:

U = Analyte analyzed for but not detected above the reported sample reporting limit.

## 14. DETAILED FINDINGS – AREA P

This Section summarizes applicable information available for Area P within QMCP derived from implementation of the SAP. The narrative follows the systematic investigative approach outlined in **Section 3**, while providing specific details about the potential human health and ecological risks associated with the historical mining operations in the subarea of QMCP.

### 14.1 SITE INSPECTION AND INVESTIGATION RESULTS

The implementation of the site inspection and investigation activities provided critical lines of evidence that link the historical documentation and the current environmental conditions in and around the Portage Canal. The following subsections present the findings of the inspection and investigation activities and provide correlation of mining era operations and their potential impacts on the nearshore and offshore environment of the Portage Canal.

#### 14.1.1 Site Inspection

The site inspection at each subarea included the inventory and locating of historical structures and similar surficial artifacts associated with the former industrial operations in the area. Each subarea was also inspected for potential physical and health hazards that were documented, photographed, and located with a GPS unit. The inventoried hazards were then qualitatively assessed for potential human health and environmental risks to determine if analytical sampling was warranted during the targeted inspection phase of the work.

On September 27, 2018, MSG field team personnel performed reconnaissance activities at Area P. In the cases where access was not requested based on historic operational and investigative findings, property conditions were evaluated from a neighboring property or public right of way where access was permitted. Access to Area P was not requested based on historic operational and investigative findings.

Therefore, the property parcel known as The People's Store, including a residential dwelling and farm totaling approximately 21 acres was visually inspected and observations were recorded from the public road right of way. The following provides a summary of the findings associated with the reconnaissance activities. A copy of the reconnaissance log is provided in **Appendix C, Site Inspections – Reconnaissance Logs, Targeted Inspections & Physical Hazards Inventory**.

##### 14.1.1.1 Reconnaissance

The reconnaissance activities did not identify potentially abandoned containers or other environmental concerns. The qualitative assessment of the reconnaissance findings in Area P did not warrant the performance of limited targeted inspection activities.

#### 14.1.2 Site Investigation

Area P was not sampled nor was historic sampling data available as part of the SI Report. Other environmental concerns are not known and further investigation as part of QMCP did not occur.

## 15. DETAILED FINDINGS – PORTAGE CANAL

This Section summarizes the findings derived from implementation of the offshore sampling components of the SAP in the QMCP. Although critical to the understanding of contaminant migration into the Portage Canal, the terrestrial portion of the investigation is emphasized in the preceding detailed findings reports for each subarea. This Section provides a comprehensive assessment of the Portage Canal using analytical results derived from the SI. The narrative follows the offshore investigative approach outlined in **Section 3**, while providing specific details about the potential human health and ecological risks associated with mining era operations as they relate to the Portage Canal as a whole.

The offshore investigation included sediment, pore water, and submerged drum content sampling from the Portage Canal and the connecting waters of Dollar Bay. The following subsections present a summary of the analytical results derived from offshore sampling activities.

### 15.1 OFFSHORE INVESTIGATION RESULTS

Similar to the terrestrial investigation, the offshore investigation activities for the QMCP were also guided by several factors. Since in-lake historical analytical data was not available, terrestrial historical analytical data was evaluated to determine if adequate characterization data was available in each study area to assess the overall sediment and surface water quality in the Portage Canal. In addition, underwater surveillance of the area, as described in **Section 3**, was used to locate and assess potential offshore waste deposits. Lastly, field observations, both terrestrial and offshore, were used to position sampling locations. Sediment and surface water sampling completed as part of the SI was conducted in accordance with the sampling methods described in **Section 3**. The following subsections present the outcomes of offshore investigative activities completed in the Portage Canal by summarizing the laboratory analytical results and characterizing their impacts on the environmental media in which they were detected.

#### 15.1.1 Portage Canal

Offshore sediment, pore water, and submerged drum content samples were collected, but surface water samples were not collected from the Portage Canal during the SI. The following subsections present a summary of the analytical results derived from offshore sampling activities in the Portage Canal.

##### 15.1.1.1 Sediment Sampling Results

Sediment sampling activities were completed on September 5, 6, 7, and 28, 2018. During this time, a total of 30 sediment samples including three QA/QC field duplicate sample were collected from 16 sampling locations. Of the samples collected, 17 samples from eight locations were offshore from subareas included in this SI Report.

Sediment sampling locations included 16 surficial sediment samples, generally ranging from 0 to 1.25 ft in depth. The investigation also included 11 deeper sediment samples collected from depths up to 3.2 ft. All samples were analyzed for PCBs and SVOCs as identified in **Table 3-1, Sampling and Analysis Summary** of this SI Report. Two samples were also analyzed for VOCs while all but two samples were analyzed for inorganic compounds.

The analytical results for sediment samples collected during the SI identified multiple organic and inorganic COCs at concentrations that exceeded applicable screening levels across the QMCP, including offshore from Areas B, E, F, M, and O. COC exceedances were detected in sample locations off-shore from areas of known historic mining operations and areas of unknown historic use in the QMCP footprint. Total PCBs were not detected in any of the samples collected from the Portage Canal.

A detailed summary of sediment analytical results collected from the Portage Canal is provided in **Table 15-1, Sediment, Pore Water, and Submerged Drum Contents Analytical Results** and depicted in **Figure 15-1a** and **Figure 15-1b, Sediment, Pore Water, and Submerged Drum Contents Analytical Results**.

#### 15.1.1.2 Pore Water Sampling Results

No surface water samples were collected from the Portage Canal during implementation of the SI; however, seven pore water samples were collected from near sediment sample locations that indicated signs of contamination (sheen and/or odor) on September 6 and 10, 2018. Three of the pore water samples were offshore from subareas included in this SI Report. All samples were analyzed for PCBs, SVOCs, and inorganic constituents, with the exception of PS45 which was only analyzed for SVOCs, as identified in **Table 3-1, Sampling and Analysis Summary** of this SI Report.

The pore water analytical results for the samples contained multiple inorganic and organic COCs at concentrations above regulatory criteria and/or screening values. Analysis of pore water samples PS02 and PS06, collected off-shore from Areas B and E, respectively, detected at least one SVOC exceeding applicable screening values. Total PCBs were not detected in any of the samples collected from the Portage Canal.

A detailed summary of pore water analytical results collected from the Portage Canal is provided in **Table 15-1, Sediment, Pore Water, and Submerged Drum Contents Analytical Results** and depicted in **Figure 15-1a** and **15-1b, Sediment, Pore Water, and Submerged Drum Contents Analytical Results**.

#### 15.1.1.3 Submerged Drum Content Sampling Results

Submerged drum content sampling activities were completed on September 9, 2018. In conjunction with sediment and pore water sampling, a total of three submerged drum samples, ranging from 12.66 to 14.56 ft in water depth, were collected from three sampling locations. One of the submerged drum content samples was offshore from a subarea included in this SI Report. All samples were analyzed for PCBs, SVOCs, and inorganic constituents as identified in **Table 3-1, Sampling and Analysis Summary** of this SI Report.

Inorganic COCs were detected above applicable screening criteria in all three samples, while SVOCs were detected above applicable screening levels in submerged drum content samples SDM02 and SDM03. Sample SDM02 was collected offshore from Area E. Total PCBs were not detected in any of the samples collected from the Portage Canal.

A detailed summary of submerged drum contents analytical results collected from the Portage Canal are provided in **Table 15-1, Sediment, Pore Water, and Submerged Drum Contents Analytical Results** and depicted in **Figure 15-1a, Sediment, Pore Water, and Submerged Drum Contents Analytical Results**.

## 15.2 NATURE AND EXTENT OF CONTAMINATION

Utilizing the established regulatory criteria presented in **Section 4**, the laboratory analytical results summarized in the preceding section were reviewed and compared to the following criteria as applicable for the sampled environmental media:

- EGLE – Rule 57 Water Quality Values;
- EGLE Part 201 Cleanup Criteria for Response Action – Residential and Nonresidential DWC and GSIC;
- EPA Ecological Screening Values (ESVs); and,
- Sediment Quality Guidelines, Threshold Effect Concentrations (TECs) and Probable Effect Concentrations

(PECs), MacDonald, et al, 2000.

### 15.2.1 Comprehensive Exposure Assessment

The comparison was completed to determine which ecological and human exposure pathways, risks, and conditions are relevant in the Portage Canal. Although not inclusive of relevant pathways where criteria were not exceeded, the following exposure pathways were determined to be relevant in the Portage Canal as it pertains to the offshore investigative activities completed during the SI:

- Risks due to hazardous substances in sediments, pore water, and submerged drum contents.

#### 15.2.1.1 Portage Canal - Exposure Pathway Assessment

Sediment analytical results from the Portage Canal identified COC concentrations that were at or above concentrations that pose potential risks to sediment dwelling species, and consequently the food chain. The following table provides a summary of the sample locations located in the Portage Canal. The table lists only the number of samples for a specific analytical suite that contained one or more exceedance of a given criterion.

| Sediment Analytical Result Summary Table                             | Analytical Summary      |                   |                   | EPA Region IV, Freshwater Sediment Ecological Screening Values (March 2018)                                                                                                                                                                                                                              | Consensus Based Sediment Quality Guidelines |                                     |

The pore water analytical results from the Portage Canal identified COC concentrations that were at or above concentrations that pose potential risks to ecological receptors, and consequently the food chain. The following table provides a summary of the sample locations located in the Portage Canal. The table lists only the number of samples for a specific analytical suite that contained one or more exceedance of a given criterion.

| Total PCBs                                                           | 6                       | 0                 | 0                 | 0                                                                       | 0                                      | 0                                            | 0                                                                    | 0                                                         | 0                                              | 0                                          | 0              |
| COCs exceeding applicable regulatory criteria in one or more samples |                         |                   |                   | COPPER, LEAD, MANGANESE, SILVER, ANTHRACENE, FLUORANTHENE, PHENANTHRENE |                                        |                                              |                                                                      |                                                           |                                                |                                            |                |

Submerged drum contents analytical results from the Portage Canal identified COC concentrations that were at or above concentrations that pose potential risks to sediment dwelling species, and consequently the food chain. The following table provides a summary of the sample locations located in the Portage Canal. The table lists only the number of samples for a specific analytical suite that contained one or more exceedance of a given criterion.

| Submerged Drum Contents Analytical Result Summary Table              | Analytical Summary      |                   |                   | EPA Region IV, Freshwater Sediment Ecological Screening Values (March 2018) | Consensus Based Sediment Quality Guidelines |                                     |
|----------------------------------------------------------------------|-------------------------|-------------------|-------------------|-----------------------------------------------------------------------------|---------------------------------------------|-------------------------------------|

## 15.2.2 Portage Canal - Extent of Contamination

The comparison of analytical results to applicable regulatory criteria indicates that potential human health and ecological risks are present in contaminated sediment, pore water, and submerged drum contents in the Portage Canal. The following subsections describe the extent of contamination.

### 15.2.2.1 Sediment - Extent of Contamination

Analytical results from sediment samples collected from offshore of the various subareas along the Portage Canal identified COCs in both surficial and deep sediment samples. These results varied between subareas likely due to the varying operational and remedial history within each area. The following provides a summary of the analytical results and their relevance to potential exposure risks for human and ecological receptors:

- Inorganic COCs – Inorganic COCs were detected at or in excess of applicable screening values or guidelines adjacent to the following subareas:
  - Area B;
  - Area E;
  - Area F;
  - Area M;
  - Area O;
  - Area P; and,
  - Other subareas/parcels addressed in other reports.

As indicated by the number of locations summarized above, metals are prevalent in the region and the related exceedances, although potentially detrimental to aquatic biota, remain a consistent finding in sediment samples collected from across the Project area. Nevertheless, exceedances of inorganic COC screening values in sediment should be considered when evaluating the extent of contamination in the Portage Canal.

- VOCs – Of the two samples that were analyzed for VOCs, toluene was detected at a concentration exceeding a screening value in SS62 in the ditch adjacent to the east side of Area F. While the upstream limit of toluene impact may be provided by SS61, the limits of impact in other directions have not been defined.
- SVOCs – SVOCs were detected in sediment at or in excess of applicable screening values or guidelines adjacent to the following subareas:
  - Area B;
  - Area E;
  - Area F;
  - Area M; and,
  - Other subareas/parcels addressed in other reports.

The detection of SVOCs in sediment samples is likely indicative of a nearby contaminant source, versus the ubiquitous nature of the inorganic COCs described above. SVOC contamination in sediment presents risks both to benthic organisms and human health due to their close proximity to the shoreline. The potential risks associated with SVOCs in nearshore sediment may be an indication of a terrestrial source of contamination that should be considered when evaluating the extent of sediment contamination in the Portage Canal.

- Total PCBs – Total PCBs were not detected in sediment samples collected as part of the SI.

#### 15.2.2.2 Pore Water – Extent of Contamination

Analytical results from pore water samples collected from the Portage Canal identified inorganic and SVOC impacts exceeding applicable screening values and comparable criteria. These results varied between subareas likely due to the varying operational and remedial history within each area, and possibly due to the presence of potential source areas as described above. The following provides a summary of the analytical results and their relevance to potential exposure risks for human and ecological receptors:

- Inorganic COCs – Inorganic COCs were detected at or in excess of applicable screening values offshore from the following subareas:
  - Area B;
  - Area E;
  - Area F; and,
  - Other subareas/parcels addressed in other reports.

Similar to the previously discussed sediment sample results, metals are ubiquitous in the study area and are predominantly the result of the presence of stamp sands. Stamp sands are not defined as a hazardous substance nor are they subject to regulation under Part 201 unless the property otherwise contains hazardous substances in excess of concentrations that satisfy the cleanup criteria for unrestricted residential use. The related exceedances, although potentially detrimental to aquatic biota, remain a consistent finding in samples collected from the Project area. Nevertheless, exceedances of inorganic COCs in pore water should be considered when evaluating the extent of contamination in the Portage Canal.

- VOCs – Pore water samples collected as part of the SI were not analyzed for the presence of VOCs.
- SVOCs – SVOCs were detected in pore water at or in excess of applicable screening values offshore from the following subareas:
  - Area B; and,
  - Area E.

The detection of SVOCs in pore water samples is likely indicative of a nearby contaminant source. SVOC contamination in pore water presents risks both to benthic organisms and potentially human health due to their close proximity to the shoreline. The potential risks associated with SVOCs in pore water from nearshore sediment may be an indication a terrestrial source of contamination that should be considered when evaluating the extent of contamination in the Portage Canal.

- Total PCBs – Total PCBs were not detected in pore water samples collected as part of the SI.

#### 15.2.2.3 Submerged Drum Contents – Extent of Contamination

Analytical results from submerged drum content samples collected from within the Portage Canal identified multiple inorganic and SVOC contaminants. Specific to this SI report, samples were collected offshore of Area E where historic mining operations and/or practices were unknown. However, sample locations were adjacent to property where historic mining operations and/or practices were known to have occurred. Due to the varying operational and remedial history within each subarea, the presence of potential source areas as described above are possible. The following provides a summary of the analytical results and their relevance to potential exposure risks for human and ecological receptors:

- Inorganic COCs – Inorganic COCs were detected at or in excess of applicable screening values offshore from the following subareas:
  - Area E.

Similar to the previously discussed sediment sample results, metals are ubiquitous in the study area and are predominantly the result of the presence of stamp sands. Stamp sands are not defined as a hazardous substance nor are they subject to regulation under Part 201 unless the property otherwise contains hazardous substances in excess of concentrations that satisfy the cleanup criteria for unrestricted residential use. The related exceedances, although potentially detrimental to aquatic biota, remain a consistent finding in samples collected from the Project area. Nevertheless, exceedances of inorganic COCs in submerged drum contents that may not be associated with stamp sand should be considered when evaluating the extent of contamination in the Portage Canal.

- VOCs – Submerged drum content samples collected as part of the SI were not analyzed for the presence of VOCs.
- SVOCs – SVOCs were detected in submerged drum content samples at or in excess of applicable screening value offshore from the following subareas:
  - Area E.

The detection of SVOCs in submerged drum content samples are indicative of drum contents or possibly of a nearby contaminant source. SVOC contamination in submerged drum content samples present risks both to benthic organisms and human health due to their close proximity to the shoreline. The limits of SVOC impacts associated with submerged drums has not been defined but is anticipated to be proximal to the respective drums if the SVOC impact is the result of drum contents and not other sources.

- Total PCBs – Total PCBs were not detected in submerged drum content samples collected as part of the SI.

### **15.3 CONCLUSIONS AND RECOMMENDATIONS**

The analytical results and interpretation summarized in the preceding subsections document ecological and potential human health risks that are present in the Portage Canal and the implications of those findings on environmental conditions throughout connected waterbodies such as Portage Lake and Torch Lake. The following subsections provide a synopsis of these findings and a recommended path forward for mitigating these risks in the QMCP and subsequently, Portage Canal.

#### **15.3.1 Conclusions**

Environmental impacts in the QMCP are generally characterized by detections of organic and inorganic contaminants in sediment, pore water, and submerged drum contents, repercussions of mining era operations in the region. Although specific sources of these contaminants may not be fully understood, historical research related to the operations, closing, and eventual abandonment/scraping of mining company operations provided substantive evidence for assessing specific operational areas and selecting target analytes anticipated to be present in environmental media throughout the area. The findings of these investigative activities, specifically as it relates to concentrations of contaminants in sediment, pore water, and submerged drum contents are summarized as follows:

#### Sediment

- Inorganic COCs – Inorganic COCs were detected at or in excess of applicable screening values offshore from the following subareas:
  - Area B;
  - Area E;
  - Area F;
  - Area M;
  - Area O;
  - Area P; and,
  - Other subareas/parcels addressed in other reports.
- VOCs – Toluene was detected at a concentration exceeding a screening value in SS62 in the ditch adjacent to the east side of Area F. While the upstream limit of toluene impact may be provided by SS61, the limits of impact in other directions have not been defined.
- SVOCs – SVOCs were detected in sediment at or in excess of applicable screening values offshore from the following subareas:
  - Area B;
  - Area E;
  - Area F;
  - Area M; and,
  - Other subareas/parcels addressed in other reports.
- Total PCBs – Total PCBs were not detected in sediment at or above applicable screening values in any of the samples collected.

#### Pore Water

- Inorganic COCs – Inorganic COCs were detected at or in excess of applicable screening values offshore from the following subareas:
  - Area B;
  - Area E;
  - Area F; and,
  - Other subareas/parcels addressed in other reports.
- VOCs – VOCs were not sampled in pore water samples collected as part of the SI.
- SVOCs – SVOCs were detected in pore water at or in excess of applicable regulatory criteria offshore from the following study areas:
  - Area B; and,
  - Area E.
- Total PCBs – Total PCBs were not detected in pore water at or above applicable screening values in any of the samples collected.

Sediment samples collected throughout the Portage Canal from the conceptual boundaries of QMCP contained multiple detections of inorganic COCs and SVOCs that exceeded applicable ecological screening values. Interpretation

of the results indicates that at least certain locations may be indicative of terrestrial source areas, particularly at properties of known historic mining related operations, such as Area B, Area F, and Area M.

A limited number of pore water samples were collected from Portage Canal and while PCBs were not detected in any of the samples at or above applicable screening values, exceedances of inorganic COCs and SVOCs were detected. Pore water results offshore of Area B and Area E may be indicative of historic offshore waste deposits and/or groundwater impacts venting to surface water.

Submerged drum contents sampling locations were primarily offshore from areas addressed as part of other EGLE SI investigations; however, they were near Area E. Historical mining era practices and/or operations are unknown in Area E.

### **15.3.2 Recommendations**

SI results have confirmed that potential ongoing sources of contamination are present in the Portage Canal. For the QMCP Areas where potential upland sources of these COCs have not previously been addressed, evaluation of remedial alternatives to mitigate concerns related to human health and/or the environment could be conducted.

ELGE should continue to provide new study data to the Remediation and Redevelopment Division Superfund Section (RRD SFS), which is responsible for monitoring EPA's remedy for the terrestrial and lake portions of the Torch Lake Superfund Site. RRD SFS should evaluate whether any remedy modifications are necessary. The EPA and RRD SFS should verify that administrative controls for areas that have been previously remediated by the EPA have been employed to ensure that the selected remedy is performing as designed and those institutional controls, where required, have been recorded and are being enforced.

Note: Analytical and Criteria Footnotes are included on the last page of the table.

TABLE 15-1

Sediment, Pore Water, and Submerged Drum Contents Analytical Results

Quincy Mining Company Portage Operations Area

Abandoned Mining Wastes - Torch Lake Non-Superfund Site

**Table Footnotes:**

- EGLE Part 201 residential and non-residential generic cleanup criteria and screening levels criteria were originally promulgated December 21, 2002 within the Administrative Rules for Part 201, Environmental Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. This table reflects revisions to the criteria pursuant to the December 2010 Part 201 amendments and new criteria consistent with the provisions of R299.5706a. Remediation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. Release Date: December 30, 2013. Updated December 21, 2020.

- EGLE Rule 57 values derived from the Michigan Department of Environment Great Lakes and Energy, Water Bureau, Water Resources Protection, filed with the Secretary of State on January 13, 2006. Part 4 Water Quality Standards, Rule 323.1057 Toxic Substances, as amended. Updated on August 1, 2019.

- ESVs are adapted from the Environmental Protection Agency Region IV Ecological Risk Assessment Supplemental Guidance, published November 1995, updated March 2018.

- TECs, and PECs are adapted from Appendix A and Appendix B of Michigan Department of Environment, Great Lakes, and Energy (EGLE) - Remediation and Redevelopment Division Operational Memorandum No. 4 Attachment 3, Interim Final August 2, 2006.

- Only detected analytes are listed - Gray rows indicate requested analyses.

- **Bold** values are concentrations detected above the laboratory reporting limit.

- **Bold/Shaded** cells indicate analyte concentration exceeded applicable criteria. Criteria exceeded is indicated by the footnote in [brackets] following the result value and defined below:

|                                                                    |                                                                                          |

**EGLE Criteritia Footnotes:**

ID = Insufficient data to develop criterion.

NA = A criterion or value is not available

NLV = Hazardous substance is not likely to volatilize under most conditions.

(A) = Criterion is the state of Michigan drinking water standard established pursuant to Section 5 of 1976 PA 399, MCL 325.1005.

(B) = Background, as defined in R 299.1(b), may be substituted if higher than the calculated cleanup criterion. Background levels may be less than criteria for some inorganic compounds.

(E) = Criterion is the aesthetic drinking water value, as required by Section 20120a(5) of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (NREPA). A notice of aesthetic impact may be employed as an institutional control mechanism if groundwater concentrations exceed the aesthetic drinking water criterion, but do not exceed the applicable health-based drinking water value provided in a table available on EGLE internet web site. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information)

(G) = Groundwater surface water interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water. The final chronic value (FCV) for the protection of aquatic life shall be calculated based on the pH or hardness of the receiving surface water. Where water hardness exceeds 400 mg CaCO<sub>3</sub>/L, use 400 mg CaCO<sub>3</sub>/L for the FCV calculation. The FCV formula provides values in units of ug/L or ppb. The generic GSI criterion is the lesser of the calculated FCV, the wildlife value (WV), and the surface water human non-drinking water value (HNDV). The soil GSI protection criteria for these hazardous substances are the greater of the 20 times the GSI criterion or the GSI soil-water partition values using the GSI criteria developed with the procedure described in this footnote. A spreadsheet that may be used to calculate GSI and GSI protection criteria for (G)-footnoted hazardous substances is available on the EGLE internet web site. A hardness value of 47.5 CaCO<sub>3</sub>/L and pH of 7, derived from the Michigan Department of Environmental Quality Draft Site Inspection Report for Lake Linden Operations dated 3/29/13, was used in the footnote G calculation spreadsheet.

(H) = Valence-specific chromium data (Cr III and Cr VI) shall be compared to the corresponding valence-specific cleanup criteria. If both Cr III and Cr VI are present in groundwater, the total concentration of both cannot exceed the drinking water criterion of 100 ug/L. If analytical data are provided for total chromium only, they shall be compared to the cleanup criteria for Cr VI. Cr III soil cleanup criterion for protection of drinking water can only be used at sites where groundwater is prevented from being used as a public water supply, currently and in the future, through an approved land or resource use restriction.

(J) = Hazardous substance may be present in several isomer forms. Isomer-specific concentrations shall be added together for comparison to criteria.

(L) = Criteria for lead are derived using a biologically based model, as allowed for under Section 20120a(9) of the NREPA, and are not calculated using the algorithms and assumptions specified in pathway-specific rules. The generic residential drinking water criterion of 4 ug/L is linked to the generic residential soil direct contact criterion of 400 mg/kg. A higher concentration in the drinking water, up to the state action level of 15 ug/L, may be allowed as a site-specific remedy and still allow for drinking water use, under Section 20120a(2) and 20120b of the NREPA if soil concentrations are appropriately lower than 400 mg/kg. If a site-specific criterion is approved based on this subdivision, a notice shall be filed on the deed for all property where the groundwater concentrations will exceed 4 ug/L to provide notice of the potential for unacceptable risk if soil or groundwater concentrations increase. Acceptable combinations of site-specific soil and drinking water concentrations are presented in a table available on the EGLE internet web site (See R 299.49 Footnotes for generic cleanup criteria tables for additional information).

(M) = Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.

(S) = Criterion defaults to the hazardous substance-specific water solubility limit.

(T) = Refer to the federal Toxic Substances Control Act (TSCA), 40 C.F.R. §761, Subpart D and 40 C.F.R. §761, Subpart G, to determine the applicability of TSCA cleanup standards. Subpart D and Subpart G of 40 C.F.R. §761 (July 1, 2001) are adopted by reference in these rules and are available for inspection at the EGLE, 525 West Allegan Street, Lansing, Michigan. Copies of the regulations may be purchased, at a cost as of the time of adoption of these rules of \$55, from the Superintendent of Documents, Government Printing Office, Washington, DC 20401, or from the EGLE, RRD, 525 West Allegan Street, Lansing, Michigan 48933, at cost. Alternatives to compliance with the TSCA standards listed below are possible under 40 C.F.R. §761 Subpart D. New releases may be subject to the standards identified in 40 C.F.R. §761, Subpart G. Use Part 201 soil direct contact cleanup criteria in the published table if TSCA standards are not applicable.

(X) = The GSI criterion shown in the generic cleanup criteria tables is not protective for surface water that is used as a drinking water source. (See R 299.49 Footnotes for generic cleanup criteria tables for additional information.)

**Rule 57 Footnotes:** ID = insufficient data to derive value; NLS = no literature search has been conducted; @ = Bioaccumulative Chemical of Concern; \* = the lowest Human Noncancer Value (HNV), Wildlife Value (WV), Human Cancer Value (HCV), or Final Chronic Value (FCV) given for this chemical will adequately protect the uses identified with an ID\* or \*  
**EPA Region IV ESV Footnote:** **Red font** indicates a bioaccumulative chemical; ^ - Screening value is for filtered (dissolved) metals. A conversion factor (CF) was used to convert the screening value for total metals in surface water to a screening value for dissolved metals in surface water. CMC (dissolved) = CMC (total) × CF. See Table 1c for screening values for total (unfiltered) metals; \* - The freshwater screening value is hardness dependent. The screening value shown in Table 1a is for dissolved metals assuming a hardness of 50 mg/L as CaCO<sub>3</sub>. A correction for site-specific hardness was based on equations listed in Tables 1b and 1c. If hardness data are unavailable hardness may be estimated as: H = 2.497 × Ca (mg/L) + 4.118 × Mg (mg/L). A site-specific hardness value of 47.5 mg/kg CaCO<sub>3</sub> was used to determine values based on equations is Table 1b and 1c for total (unfiltered) metals.

**Laboratory Footnotes:**

J = The result is an estimated quantity.

U = Analyte analyzed for but not detected above the reported sample reporting limit.

## 16. CONCLUSIONS AND RECOMMENDATIONS

The analytical results and interpretation summarized in the detailed findings presented in **Section 5** through **Section 15** document potential human health and ecological risks that are present in the QMCP. The following subsections provide a synopsis of these findings and a recommended path forward for mitigating the identified risks.

### 16.1 CONCLUSIONS

Environmental impacts in the QMCP are generally characterized by detections of organic and inorganic contaminants in soil, sediment, groundwater, and pore water; repercussions of mining era operations in the region. Although specific sources of these contaminants may not be fully understood, historical research related to the operations, closing, and eventual abandonment/scrapping of mining company operations provided substantive evidence for assessing specific operational areas and selecting target analytes anticipated to be present in environmental media throughout the area.

The findings of these investigative activities are summarized as follows with respect to the goals and objectives for the Project relative to the EGLE criteria at the time of Project completion:

- ACM was not identified in the study area.
- PCBs were only detected at one location (in Area J) and no soil, sediment, groundwater, or pore water samples analyzed for PCBs exceeded criteria or screening values in the study area.
- The shallow and subsurface soil and groundwater analytical results for the QMCP SI contained a number of COCs at concentrations at or above applicable regulatory criteria. Results by subarea include:
  - Area A
    - Soil – Exceeded GSIPC
    - Groundwater – Exceeded Residential and Nonresidential DWC, GSIC, Residential and Nonresidential VIAC, and water solubility
    - Predominant COCs – VOCs, SVOCs, cyanide, and chloride
  - Area B
    - Soil – Exceeded Residential and Nonresidential DWPC, GSIPC, Residential VIAC, and Residential and Nonresidential DCC
    - Groundwater – Exceeded Residential and Nonresidential DWC, GSIC, Residential and Nonresidential VIAC, and water solubility
    - Predominant COCs – Inorganics, VOCs, SVOCs, cyanide, and chloride
  - Area E
    - Soil – Exceeded GSIPC
    - Groundwater – No exceedances
    - Predominant COCs – Inorganics, SVOCs
  - Area F
    - Soil – Exceeded Residential and Nonresidential DWPC, GSIPC, and Residential and Nonresidential DCC
    - Groundwater – No exceedances
    - Predominant COCs – Inorganics, VOCs, SVOCs, cyanide

- Area H
  - Soil – Exceeded GSIPC
  - Groundwater – No exceedances
  - Predominant COCs – Inorganics, VOCs,
- Area J
  - Soil – Exceeded GSIPC, Residential and Nonresidential PSIC, and Residential DCC
  - Groundwater – Not Sampled
  - Predominant COCs – Inorganics and VOCs
- Area K
  - Soil – Not Sampled
  - Groundwater – Not Sampled
- Area M
  - SACM – Asbestos not detected
  - Soil – Exceeded GSIPC and Residential and Nonresidential DCC
  - Groundwater – No Exceedances
  - Predominant COCs – Inorganics, VOCs, and SVOCs
- Area O
  - Soil – Not sampled
  - Groundwater – No exceedances
  - Predominant COCs – Pentachlorophenol
- Area P
  - Soil – Not sampled
  - Groundwater – Not sampled
- At Area B, reconnaissance activities identified one area of potentially oil stained soil that was observed originating from a hole to the north of the MDNR trail property, crossing the trail, and extending down to the edge of the Portage Canal. In addition, a suspect UST was observed along the shoreline. The source of the observed oil stained soil adjacent to the MDNR trail property has not been identified. At Area F, reconnaissance activities identified a pile of soil that had an oily odor along the MDNR trail property. Assessment activities detected soil impacts in certain areas of the MDNR trail property that exceeded Residential and Nonresidential DWPC, GSIPC, and Residential and Nonresidential DCC.
- Sediment analytical results exceeded ESVs, TECs, and PECs for inorganic contaminants and SVOCs, and exceeded an ESV for toluene.
- Pore water analytical results exceeded Residential and Nonresidential DWPC, GSIC, acute and chronic ESVs for inorganic compounds and SVOCs, and two samples exceeded the EGLE Rule 57 Human Drinking Water Non-Cancer Values for copper and/or lead.

The analytical results summarized above provide sufficient analytical data and lines of evidence to conclude that several subareas of QMCP are Facilities as defined in Section 20101(1)(s) of the NREPA. The following table provides a summary of the affected environmental media, applicable regulatory criteria, and potential receptors within the QMCP.

| QMCP – Media, Criteria, Potential Receptor Summary                  |                           |                                     |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                     |                              |                |                        |            |            |              |                                         |                              |               |              |

Although relevant, EGLE drinking water and groundwater/surface water interface pathway criteria exceedances for metals are excluded from the soil and groundwater evaluation in the detailed findings. The rationale for this exclusion is twofold:

- The Project investigation and anticipated response actions are being undertaken pursuant to Part 201 of Michigan's NREPA, being PA 451 of 1994, as amended. The concentrations of metals in excess of EGLE drinking water and surface water pathway criteria are ubiquitous in the study area and are predominantly the result of the presence of stamp sands. Stamp sands are not defined as a hazardous substance nor are they subject to regulation under Part 201 unless the property otherwise contains hazardous substances in excess of concentrations that satisfy the cleanup criteria for unrestricted residential use; and,
- The study area is part of OU 2 for which the EPA ROD remedy called for No Action. The EPA's ROD for OU 2 includes groundwater, surface water, submerged tailings and sediments in Torch Lake, Portage Lake, the Portage Canal, and other area water bodies. Note that EPA's No Action determination relies on the following to mitigate the effects of stamp sand to the extent practicable:
  - The reduction of stamp sand loading to surface water bodies expected as a result of the remedial action taken at OU 1 and OU 3.
  - Ongoing natural sedimentation and detoxification.
  - Institutional programs and practices controlling potential future exposure to site-affected drinking water that were intended to be administered at the county and state level.
  - The long-term monitoring and the five-year review process monitoring requirements of the remedy selected for OU 1 and OU 3 under the 1992 ROD.

Note that metals criteria for other relevant pathways, and organic and cyanide contaminants for all pathways were included in the evaluation.

In addition to the evaluation of analytical results collected from the study area, the following provides a summary of findings derived from the assessment of the QMCP with respect to the goals and objectives for the Project:

- Terrestrial sources of contamination are present in the form of inorganic COCs, SVOCs, VOCs, and cyanide in the study area;
- In-lake sources of contamination are present in the form of inorganic COCs and SVOCs in the study area sediments and some areas of pore water. The detection of SVOCs in at least certain locations may be indicative of terrestrial source areas;
- No in-lake or terrestrial uncharacterized waste deposits were identified in the study area;
- PCBs were only detected at one location (in Area J) and no samples analyzed for PCBs exceeded EGLE criteria in the study area;
- ACM was not identified in the study area; and,
- Industrial ruins, including foundations and building floors associated with mill ruins are present. Uneven terrain, structure remnants, and metal debris pose a potential physical hazard due to slip, trip, and fall concerns.

## 16.2 RECOMMENDATIONS

The conclusions outlined in the preceding subsection establish that certain parcels within QMCP are Facilities. The following is an outline of options for managing potential exposure risks in the QMCP and Portage Canal.

Section 20107a of Part 201 of NREPA describes the duties of owners or operators of a Facility, regardless of their liability, including: prevent unacceptable exposures, prevent exacerbation, and take reasonable precautions against the foreseeable actions of third parties. Some exceptions may apply; in any case, owners and operators of contaminated properties should become familiar with Section 20107a and the associated Rules.

Actions have been taken through the implementation of remedial measures, such as the placement of a soil and vegetative cap on bulk waste deposits in Area M and Area O in Dollar Bay, to address certain environmental issues.

Future property users could conduct a risk assessment based on current and anticipated future land-use to help identify remedial goals for properties where potential risks may be present. Assessment based on current and future land-use contributes to the beneficial and safe re-use and potential redevelopment of any given property by clarifying applicability of regulatory statutes, as traditional property zoning (residential versus nonresidential) is generally undefined in the study area.

Once property-specific exposure risks have been evaluated, remedial objectives can be established with appropriate land use restrictions that minimize or eliminate potential exposure risks. These land-use restrictions, or administrative controls, could be employed to ensure that exposures are reliably restricted by a restrictive covenant, institutional control, or other mechanism allowed for under Part 201.

By copy of this SI Report, the Project findings were provided to RRD SFS which is responsible for monitoring EPA's remedy for the Torch Lake Superfund Site. RRD SFS should evaluate whether any remedy modifications are necessary

in the Portage Canal or terrestrial areas previously addressed by EPA in light of the additional information provided by the Project.

EGLE should continue to provide new study data to governmental stakeholders responsible for implementation and monitoring EPA's remedy for the terrestrial and in-lake portion of the Torch Lake Superfund Site so they can determine if any remedy modifications are necessary in light of the additional information provided by the Project. Responsible stakeholders should verify that administrative controls for areas that have been previously remediated by the EPA have been employed to ensure that EPA's selected remedy is performing as designed and those institutional controls, where required, have been recorded and are being enforced.

Additionally, EGLE should continue to provide new study data to property owners and governmental stakeholders responsible for assessing potential public health impacts and making recommendations to the public, property owners, and other state agencies.

Proposed Sample Count 16 54 46 14 31 2

For the purposes of this investigation, sediments include residues and waste material associated with chemical containers and deposits on the lake bottom historically discarded in Torch Lake and the Canal.  
In areas that have been resurfaced or capped, analytical samples were collected from directly beneath the cap/resurfacing medium (i.e. soil cap, beach sand, gravel, etc...) so that samples are representative of historical waste deposits.  
Samples described in this evaluation may actually refer to stamp sands or to other mining waste from the historic mining and reclamation processes conducted in the area.  
Evaluation based on EGLE Criteria at time of Project completion.

SUBJECT: Quincy Mining Company Portage, Houghton County, SITE ID #31000098  
Bathymetric Investigation-Side Scan Sonar

This memorandum summarizes the findings of a marine investigation requested by the Department of Environmental Quality (DEQ), Remediation and Redevelopment Division's (RRD's), Calumet office for the subject site. On August 18, 2017, RRD's Geological Services Unit (GSU) conducted side scan sonar surveys of three areas to identify potential targets for future investigation.

The three investigation areas are located in the Keweenaw Waterway offshore from the communities of Ripley and Dollar Bay, Section 36, T55N-R34W and Sections 31, 32 and 33, T55N-R33W, Houghton County, Michigan (Fig 1).

The GSU collected side scan sonar data using a Humminbird 797c<sup>2</sup> equipped with an external global positioning system (GPS) antenna. Potential targets were identified and selected during post processing using HYPACK 2016. Target locations for each investigation area are shown on Figure 1 and target coordinates are presented in Table 1.

| Area:                                 | B (from MDNR Trail property)                   |
| Property (Common Name):               | Houghton County Road Commission                |
| Property Identification Number/Owner: | 006-136-013-00/Houghton County Road Commission |
| Inspection Date:                      | 9/13/2018                                      |

**General Property Description (Significant Landscape Features, Topography, Cover, Etc.):**  
Review of the 1907 Sanborn Map indicates Lake Superior Iron Works operated in the southern portion of Area B. The site is identified as the Portage Lake Foundry and Machinery Company on the 1928 Sanborn Map and by 1949 was the location of the Houghton County Road Commission. The northern portion of Area B was identified as a Store House with additional dwellings in 1928 and the location of a filling station in 1949. Area B is currently the location of the Houghton County Road Commission. Observations of the Houghton County Road Commission property were made from the Copper Heritage Trail ROW that runs south of the property. This property is bound to the south by the trail and the Portage Canal. The ROW for Highway M-26 transects the property with a portion of the parcel located to the north of M-26. The Houghton County Marina is located to the west and the Quincy Smelting Works is located to the east. The property includes various buildings and garages, including storage locations that appear to be used for county road operations. Topography is relatively flat, sloping gently to the Portage Canal. Access to the property is restricted by fencing.

| Description                                                                                                                                                       |  | Notes:                                                                                                   |   | Potentially Abandoned Containers |            |                    |            |                 |                     |                  |                          |            |                        |            |                                         |                      |   | Batteries | Fire Extinguishers | Other Items | Suspect Asbestos Containing Material | Residual Process Material | Potential PCB/Mercury Containing Equipment | Waste Pile | Outfalls | Soil Staining/Stressed Vegetation | Physical Hazards | Field Sample Recommendation | Field Sampled 2018-2019 | Targeted Sample ID | Asbestos Friable/Non-friable | Container Count per Obs. Inspection Date:

9/25/2018

**General Property Description (Significant Landscape Features, Topography, Cover, Etc.):** Historic land use and/or operations are unknown following review of available historic Sanborn Maps and other resources. The area is currently undeveloped and appears to be used for boat storage. In July 2018, a Michigan Department of Natural Resources (MDNR) surveyor observed potentially impacted soils within the ROW of the Hancock/Ripley Trail within Area E. Observations of this property were made from the Copper Heritage Trail that transects the property. The property contains one small cabin near the shoreline and contains evidence of flooding is apparent. Additional residential properties are located north of the MDNR trail. Apparent historic dump areas were observed near the Portage Canal, potentially exposed by June 2018 floodwaters.

APPENDIX C  
Reconnaissance, Targeted Sampling, and Potential Chemical and Physical Hazards Inventory  
Quincy Mining Company Portage Operations Area  
Abandoned Mining Wastes - Torch Lake Non-Superfund Site

Area:

F (from MDNR Trail property)

Property (Common Name):

Keweenaw Consignment & others

Property Identification Number/Owner:

006-167-013-00

Inspection Date:

9/25/2018

**General Property Description (Significant Landscape Features, Topography, Cover, Etc.):** A manufactured gas plant was in operation at the location of Area F, south of the Hancock/Ripley trail. Environmental concerns within this area have previously been addressed and further investigation as part of QMCP will not occur. A Filling Station and Bulk Oil Station that included various gasoline, kerosene, and fuel oil tanks, along with oil and oil pump houses operated within the northwestern portion of Area F, as identified on the 1949 Sanborn Map. This set of properties is bound to the north by the ROW for Highway M-26 and to the south by the Portage Canal. Keweenaw Consignment currently operates at the location north of the Hancock/Ripley trail, while a residential building and vacant lot are located to the south and east, respectively. A relatively undeveloped property that appears to be used for boat storage is located to the west, while Julio Contracting Company is located to the east. The ROW for the Copper Heritage Trail transects the area. A three bay garage in a fenced area is observed towards the southwest shoreline and MDNR monuments are located on the south side of the secured fence line. In addition, a residence is located to the south of the trail along the southeast shore. Hanke Auto Sales & Service operates in the vicinity of the former Filling Station and Bulk Oil Station to the northwest, north of the trail. Keweenaw Consignment is located to the east, followed by a vacant lot, all north of the trail. A culvert running parallel to trail, four stickup pipes, (two either side of trail) and a fire hydrant are all observed in the open space to the east of the area. Topography is relatively flat, sloping gently to the Portage Canal. This is an unsecured area easily accessed by the public via the trail.

| Description                                                              |  | Notes: |  | Potentially Abandoned Containers |            |                    |            |                 |                     |                  |                          |            |                        |            |                                         | Batteries | Fire Extinguishers | Other Items | Suspect Asbestos Containing Material | Residual Process Material | Potential PCB/Mercury Containing Equipment | Waste Pile | Outfalls | Soil Staining/Stressed Vegetation | Physical Hazards | Field Sample Recommendation | Field Sampled 2018-2019 | Targeted Sample ID | Asbestos Friable/Non-friable | Container Count per Obs. Area:

H

Property (Common Name):

Wuebben Property: Dollar Bay Motorsports, Isle Royale Seaplanes, Wuebben Construction

Property Identification Number/Owner:

006-031-033-00/Jed Wuebben

Inspection Date:

9/25/2018

**General Property Description (Significant Landscape Features, Topography, Cover, Etc.,)** : Historic land use and/or operations are unknown following review of available historic Sanborn Maps and other resources. The area is currently the location of Dollar Bay Motor Sports, Isle Royale Seaplanes, and Wuebben Construction. Observations of this property were made from the Copper Heritage Trail ROW that transects the property. Buildings on the property appear to be used for commercial operations of the aforementioned businesses. The ROW for the trail transects the property, with a parking lot located north of the trail and business operations to the south of the trail.

APPENDIX C  
Reconnaissance, Targeted Sampling, and Potential Chemical and Physical Hazards Inventory  
Quincy Mining Company Portage Operations Area  
Abandoned Mining Wastes - Torch Lake Non-Superfund Site

Area:

J

Property (Common Name):

H&Y Marina

Property Identification Number/Owner:

006-031-036-00/H&Y Inc.

Inspection Date:

9/26/2018

**General Property Description (Significant Landscape Features, Topography, Cover, Etc.):** Area J was the location of the Houghton Lumber Yard Company and the Dollar Bay Lumber Company, according to the 1917 and 1928 Sanborn Maps, respectively. However, according to the 1949 Sanborn Map, Henry Borth Company Manufacturing R.R. Shims and UP Oil Company operated within the area. H&Y Marina currently operates at the location. This property is bound to the north by the ROW for Highway M-26 and to the south by the Portage Canal. A residential property is located to the east. The property includes one marina building, an unpaved parking lot and ring road, a boat launch, boat docks and various boat slips. Topography is relatively flat, sloping gently to the Portage Canal. Access is not restricted to the property. The area is easily accessed by the public via the ROW for the Copper Heritage Trail that transects the property.

APPENDIX C  
Reconnaissance, Targeted Sampling, and Potential Chemical and Physical Hazards Inventory  
Quincy Mining Company Portage Operations Area  
Abandoned Mining Wastes - Torch Lake Non-Superfund Site

Area:

Property along M-26 from H&Y Marina to K

Property (Common Name):

Mixed use, residential dwellings

Property Identification Number/Owner:

Various

Inspection Date:

9/27/2018

**General Property Description (Significant Landscape Features, Topography, Cover, Etc.):** Field inspectors did not acces these private properties. Observations were recorded from the public right of way. Various single-family residential houses and multi-family condominiums are located along this stretch of shoreline east of H&Y Marina to the Former Amoco Tank Farm. According to the 1907 Sanborn Map, Tamarack and Osceola Mining Company had mining operations at the location of Area K. By 1917, the location was the site of a Calumet and Hecla Mining Company Coal Dock. The area is currently the location of the Bayside Condominiums complex. The Copper Heritage Trail runs north of the properties, adjacent to the ROW for Highway M-26, and the Portage Canal bounds the properties to the south. The property located within Area K includes condominium buildings, with an additional building currently under construction and what appears to be a commerial garage building to the east. Topography is relatively flat, sloping gently to the Portage Canal. Access to the property is restricted by an electronic gate. The area is well-vegetated with trees and substantial grass coverage. No historic or mining era features were observed on the property during the inspection.

| Area:                                 | M                                                        | <b>General Property Description (Significant Landscape Features, Topography, Cover, Etc.):</b><br>Lake Superior Smelting Company operated at the location, as identified on the 1928 Sanborn Map; however, only two ice houses remained at the property on the 1949 Sanborn Map. The EPA as part of the Torch Lake Superfund Site remedial action capped portions of Area M, N, and O. Dollar Bay Torch Lake EPA Superfund Site as-built drawings (USDA NRCS, 2004) indicate that the cap was placed as part of the Torch Lake Superfund Site Dollar Bay remedial action. The Fourth Five-Year Review Report for the Torch Lake Superfund Site (USEPA, 2018) indicated that construction was completed in 2002; however, the Dollar Bay parcel has not been deleted from the NPL. The capped areas are subject to an on-going DEQ O&M plan. The balance of the areas were not addressed as part of the Torch Lake Superfund Site remedial action. The area appears to be undeveloped with the exception of a building that houses two production wells for water supply to Dollar Bay. This area is bound to the north, west and east by residential properties and the Dollar Bay Wire Mill to the east-southeast. The Portage Canal bounds the southwest property line. A portion of the property is capped to the southeast. Remains of concrete foundations and piles of brick debris from the former smelter operations are observed in the central portion of the property and there is evidence of trespassers, including a camp and various fire rings along the shoreline. The wooded northern portion of the property slopes downward towards a more open area that is relatively flat. While the main access road is secured with a locked gate, the property is accessible by foot via various trails. |  |
| Property (Common Name):               | Dollar Bay Well Field                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |  |

RECONNAISSANCE, TARGETED SAMPLING, AND POTENTIAL CHEMICAL AND PHYSICAL HAZARDS INVENTORY

APPENDIX C  
Reconnaissance, Targeted Sampling, and Potential Chemical and Physical Hazards Inventory  
Quincy Mining Company Portage Operations Area  
Abandoned Mining Wastes - Torch Lake Non-Superfund Site

Area:

O

Property (Common Name):

Horner Flooring

Property Identification Number/Owner:

009-033-052-00/Horner Acquisition

Inspection Date:

9/27/2018

**General Property Description (Significant Landscape Features, Topography, Cover, Etc.):** Field inspectors did not acces this private property. Observations were recorded from the public right of way. According to the 1907 Sanborn Map, Area O was the location of Dollar Bay Land and Improvement Company. The parcel is identified as Dollar Bay Lumber Company in 1917 and Dollar Bay Lumber Company Saw Mill and Lumber Yard and Horner Flooring Company Wood Flooring Mill in 1949. Horner Flooring Co. Inc., a manufacturer of hardwood maple basketball flooring, currently operates at the location. The EPA as part of the Torch Lake Superfund Site remedial action capped portions of Area M, N, and O. Dollar Bay Torch Lake EPA Superfund Site as-built drawings (USDA NRCS, 2004) indicate that the cap was placed as part of the Torch Lake Superfund Site Dollar Bay remedial action. The Fourth Five-Year Review Report for the Torch Lake Superfund Site (USEPA, 2018) indicated that construction was completed in 2002; however, the Dollar Bay parcel has not been deleted from the NPL. The capped areas are subject to an on-going DEQ O&M plan. The balance of the areas were not addressed as part of the Torch Lake Superfund Site remedial action. Topography is relatively flat, sloping gently to the Dollar Bay. The area appears to be well-vegetated with trees and substantial grass coverage to the south. Reconnaissance investigation is recommended.

APPENDIX C  
Reconnaissance, Targeted Sampling, and Potential Chemical and Physical Hazards Inventory  
Quincy Mining Company Portage Operations Area  
Abandoned Mining Wastes - Torch Lake Non-Superfund Site

Area:

P

Property (Common Name):

Unknown

Property Identification Number/Owner:

Various

Inspection Date:

9/27/2018

**General Property Description (Significant Landscape Features, Topography, Cover, Etc.):** Field inspectors did not acces this private property. Observations were recorded from the public right of way. This area was not identified on available Sanborn Maps; however, review of Monette's Dollar Bay, Michigan, *Fifty-Fourth of a Local History Series* (Monette, 2000), indicates that the parcel was owned by Lake Superior Smelting Company and was used as a slag dump. Present day use appears to be a scrap/recycling facility called "The People's Store," and includes a residential and farm area to the east. Topography is relatively flat, sloping gently to the Dollar Bay. The area appears to be vegetated with tree coverage to the south, along Point Mills Road and more barren to the northwest. No historic or mining era features were observed on the property during the inspection.

**APPENDIX D**

**PHOTOGRAPHIC LOG**

Photo 1: View of drums and containers with potential unknown contents, identified as Observation Number CONT001. Photo taken 9/13/2018.

Photo 2: View looking south of the open channel discharge to the Portage Canal identified as Observation Number Outfall001. Photo taken 9/13/2018.

Photo 1: View looking southeast of distressed pine trees, identified as Observation Number VEG001. Photo taken 9/13/2018.

Photo 2: View looking north of stained soils, identified as Observation Number Soil001. Photo taken 9/13/2018.

Photo 3: View of a partially buried steel tank along shoreline, identified as Observation Number CONT002. Photo taken 9/13/2018.

Photo 1: View looking southwest from the Trail ROW in Area E. Photo taken 9/25/2018.

Photo 2: View looking northwest from the Trail ROW in Area E. Photo taken 9/25/2018.

Photo 3: View of a culvert outlet north of the Trail ROW in Area E. Photo taken 9/25/2018.

Photo 1: View of a potential mercury containing household thermostat along Trail ROW, identified as Observation Number SHG004. Photo taken 9/25/2018.

Photo 2: View of soil with oily odor, mixed with concrete, debris, and branches pushed back along Trail ROW, sampled as QMCP-SS51. Photo taken 9/28/2018.

Photo 1: View of debris piles and building foundations near the central portion of the property. Photo taken 9/26/2018.

Photo 3: View of a crushed drum carcass filled with foam board insulation and a plastic jug, identified as Observation Number CONT117. Photo taken 9/26/2018.

Photo 2: View of green roofing material, sampled as QMCP-ASBBLK58. Photo taken 10/1/2018.

## APPENDIX G

### LABORATORY ANALYTICAL REPORTS

## **Appendix G**

### **Laboratory Analytical Reports**

#### **Bound Separately**

## APPENDIX H

### CONCEPTUAL SITE MODEL – EXPOSURE PATHWAY EVALUATION

**Conceptual Site Model - Exposure Pathway Evaluation**  
 Quincy Mining Company Portage Operations Area  
 Abandoned Mining Wastes - Torch Lake Non-Superfund Site

**Notes:**

- ☒ Indicates this portion of exposure pathway is present at QMCP.
- ☒ Indicates this criterion is exceeded at QMCP.

<sup>1</sup> DEQ-RD Op Memo 1 (updated December 30, 2013), unless otherwise noted

Roman numerals indicate EGLE criterion number

<sup>2</sup> Classification (Adapted from EGLE Op Memo 3)

- 1 Immediate (Exposure is currently occurring).
- 2 Short term threat (between 0 and 2 years until exposure)
- 3 Long term threat (more than 2 years until exposure)
- 4 No demonstrable long-term threat

Future Classification - Classification expected if remedy is successful.

Drinking water and groundwater/surface water pathway criteria exceedances for metals are excluded from the evaluation.
