

Is there anything else I need to do?

- ASK** Hospital staff or your midwife if newborn screening was done.
- BE SURE** The hospital or midwife and your baby's health care provider have the right phone number and address to reach you.
- CHECK** With your baby's health care provider or midwife about the NBS results.
- FOLLOW** Directions from your baby's health care provider if more tests or medical appointments are needed.

**Learn about blood
spot screening...**

What is Newborn Screening (NBS)?

NBS is a program that screens all babies at 24-36 hours of age for rare but serious disorders. Michigan law requires newborn screening to make

sure babies who need treatment are found early. As part of newborn screening,

your baby is checked for hearing loss and signs of critical congenital heart disease. A few drops of blood are also taken from your baby's heel to fill spots on a filter paper card. The card is sent to the State Newborn Screening Laboratory where blood spots are tested for more than 50 different disorders that benefit from early treatment. This pamphlet describes newborn blood spot screening.

My baby seems really healthy. Is NBS still needed?

YES! Whether your baby is born in a hospital, non-hospital setting or at home, screening should be done. Most babies with these disorders seem healthy at birth but can become very sick in a short time. If not treated early, serious health problems, severe developmental delays and even death can occur. NBS is the best way to find nearly all babies who have these disorders as early as possible.

What happens if screening suggests a health problem?

The NBS Follow-up Program will alert your baby's health care provider. You will get a call about what to do next, but it does not always mean your baby will have a problem. Additional testing may be needed.

What are the disorders?

In Michigan, blood spot screening looks for more than 50 disorders that may affect:

- n Blood cells
- n Brain development
- n How the body breaks down nutrients from food
- n Lungs and breathing
- n Hormones
- n How the body fights infection

Congenital hypothyroidism, sickle cell disease and cystic fibrosis are some of the most common disorders. For a complete list, visit:

Michigan.gov/NewbornScreening.

NBS may also find some babies who are healthy carriers of these disorders.

What happens if my baby has one of these disorders?

Help is available if your baby is found to have a disorder. Treatment usually begins early and continues through life. Each year, newborn blood spot screening finds about 270 Michigan babies with these medical disorders.

How is the cost of NBS covered?

If your baby is born in a non-hospital setting, your birth attendant should have an NBS card and can determine if you qualify for a free screening. You may call 517-335-1400 with any questions.

What happens to my baby's blood spots after screening?

All of the blood spots are not always needed for screening. The remaining blood spots are sent for storage. While in storage, blood spots may be used by the state lab to perform quality control tests and improve newborn screening or for your personal use, if needed.

Remaining blood spots from newborn screening may be made available for future medical research with a parent's consent. To learn more, please read the Michigan BioTrust for Health pamphlet or visit Michigan.gov/BioTrust.

State law allows you to ask that a second blood spot sample be taken for your safekeeping. If you would like a second sample, please talk to your health care provider.

Forms are available if you want your child's blood spots destroyed after newborn screening is complete. Please call 866-673-9939 for more information or visit Michigan.gov/NewbornScreening.
