Existing Advisory: Gratiot Lake northern pike are covered under the statewide mercury advisory.

Recommendation: A dataset of less than five data points for a given chemical, species and waterbody is considered insufficient for evaluation using the standard evaluation method.

Statewide guidelines apply: No one should eat more than 1 meal per month of northern pike larger than 30 inches or more than 2 meals per month of northern pike smaller than 30 inches in length.

Toxaphene	--	--					
PFOS	0.093	0.035		Final meal category based on UCL: 1			

*One sub-legal sized fish was used in the PFOS analysis as there has not been a significant correlation between fish size and PFOS observed in the statewide dataset.

Existing MDHHS Advisory: No one should eat more than 1 meal per month of largemouth or smallmouth bass from Lake Medora in Keweenaw County smaller than 18 inches or more than 6 meals per year of these fish larger than 18 inches due to mercury. The statewide length break was applied as the size range of the fish was limited.

Recommendation: No change to the advisory is warranted. PFOS should be added to the list of contaminants causing less restrictive guidance.

Walleye**Lake Medora****Keweenaw County****Hg Analysis:**

	R ²	R ²				
PCB	--	--				
DDT	--	--				
Chlordane	--	--				
Toxaphene	--	--				
Final meal category based on UCL:						--

Existing Advisory: Women and children should eat no more than one meal per week of Siskiwit Lake lake whitefish of any size due to PCBs.

Recommendation: Data is insufficient to determine a waterbody-species guideline for whitefish from Siskiwit Lake.

Note: There is no statewide guidance for lake whitefish from inland lakes. Based on the maximum Hg concentration the meal category would be 4 meals per month; maximum PCB concentration discounted for age of data would cause a 1 meal per month recommendation. A 2 meal per month recommendation tracks well with advice for lake trout from this lake.

Northern Pike**Siskiwit Lake

Final meal category based on UCL: Limited						

Existing Advisory: Women and children should eat no more than one meal per month of channel catfish from the Manistique River downstream of Manistique Papers dam between less than 18 inches in length and no more than six meals per year of channel catfish greater than 18 inches in length due to elevated concentrations of PCBs.

Recommendation: Sensitive populations should not eat any catfish from the Manistique River downstream of the Manistique Papers dam due to PCBs. Healthy adults should limit consumption to 1 or 2 meals per year of catfish from the Manistique River downstream of the Manistique Papers dam. Mercury, DDT and toxaphene would cause advisories. This dataset is limited due to the age of the data, however, this water has legacy contamination of PCBs and requires new data to relax this guideline.

Existing Advisory: Largemouth bass from the Manistique River downstream of Manistique Papers dam are not covered by a consumption advisory.

Recommendation: This dataset is limited due to sample size and age of the data, and cannot be used to provide a recommendation. See smallmouth bass recommendation: No one should eat more than 1 meal per month of largemouth or smallmouth bass from the Manistique River downstream of Manistique Papers dam due to elevated concentrations of PCBs.

* The downstream portion of the Carp River is designated as a Type 3 trout stream with a 15-inch minimum size limit. The rest of the Carp River downstream of Deer Lake is Type 2 with a 10-inch minimum size limit. The 10 inch size limit was used for this analysis.

[^] Only 3 legal sized fish were collected; therefore, sub-legal sized individuals were used in the analysis.

Existing MDHHS Advisory: No one should eat more than 4 meals per month of brook trout of any size from the Carp River downstream of Deer Lake due to mercury.

Recommendation: No change to the advisory is recommended. PCBs and PFOS should be added to list of contaminants causing less restrictive guidance.

Existing Advisory: Carp River walleye are covered under an “all other species” do not eat advisory due to mercury.

Recommendation: A dataset of less than five data points for a given chemical, species and waterbody is considered insufficient for evaluation. The statewide guidelines apply.

Final meal category based on UCL:							0.5

Existing Advisory: Dead River at Forestville Basin northern pike are covered under the statewide mercury advisory.

Recommendation: No one should eat more than 6 meals per month of Dead River (including the Silver Lake Basin, Hoist Basin [aka Dead River Storage Basin], McClure Basin, Forestville Basin, and Tourist Park Basin) northern pike smaller than 30 inches due to mercury. No one should eat fish larger than 30 inches. The statewide length break was applied. Consideration was given to setting the length break to the maximum measured length, however, the UCL is 1.21 ppm, leaving a sufficient concentration range for fish between 24 and 30 inches before reaching the do not eat meal category.

Smallmouth Bass**Dead River

Final meal category based on UCL:							1

Existing Advisory: Escanaba River at Cataract Basin walleye are covered under the statewide mercury advisory.

Recommendation: No one should eat more than 1 meal per month of Cataract Basin walleye smaller than 20 inches or more than 6 meals per year of those fish larger than 20 inches due to mercury. The statewide length break was applied.

Note: The size range of fish in this sample set is limited. Advice is 1 step more restrictive than the statewide advisory for walleye.

Existing Advisory: Greenwood Reservoir largemouth bass are covered under the statewide mercury consumption advisory.

Recommendation: No one should eat more than 1 meal per month of Greenwood Reservoir largemouth or smallmouth bass smaller than 18 inches or more than 6 meals per year of those fish larger than 18 inches.

Note: A dataset of less than five data points for a given chemical, species and waterbody is considered insufficient for evaluation using the standard evaluation method. The mean mercury concentration compared to the FCSV is one meal per month. Northern pike from the same waterbody were highly contaminated with mercury. The guideline is set to one meal category more restrictive than the statewide guidelines.

* samples collected from Goose Lake inlet, Goose Lake outlet, Green Creek, Escanaba River, Warner Creek

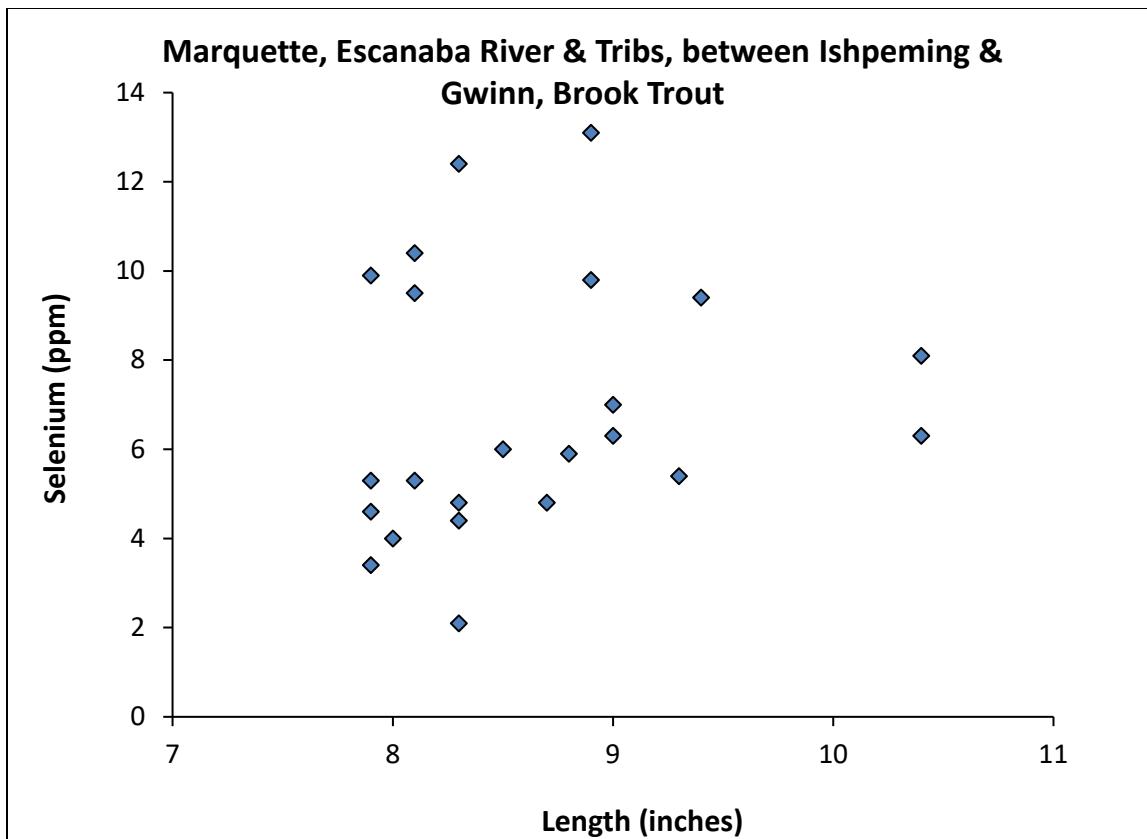

Existing Advisory: No one should eat more than 1 meal per week of brook trout from select reaches of the East Branch and Middle Branch Escanaba River and select tributaries to those river reaches.

Recommendation: No one should eat more than 4 meals per month of brook trout or white suckers[^] from the East Branch Escanaba River upstream of Gwinn¹, the Middle Branch Escanaba River from the Cataract Dam downstream to Gwinn, and Green Creek from the Empire Tailings dam to the Middle Branch Escanaba River due to selenium.

¹ including Warner Creek, Goose Lake Inlet and Outlet, Schweitzer Creek, Ely Creek, and smaller tributaries

[^] White sucker are included because whole suckers and whole brook trout were analyzed for selenium from these waters and found to have similar levels of contamination (DEQ Selenium Monitoring Work Group 2009, MI/DEQ/WB-09/038). Suckers have been found to be able to have elevated filet selenium concentrations (see Goose Lake).

Note: samples were collected and analyzed by Cleveland Cliffs Iron (CCI) and found acceptable by DEQ (now EGLE) because the methods were not complicated and Se concentration in fillets is not sensitive to processing.

Existing Advisory: Johnson Lake northern pike are covered under the statewide mercury advisory.

Recommendation: A dataset of less than five legal length data points for a given chemical, species and waterbody is considered insufficient for evaluation using the standard evaluation method. The statewide guidelines apply to Johnson Lake northern pike: No one should eat more than 1 meal per month of northern pike larger than 30 inches or more than 2 meals per month of northern pike smaller than 30 inches in length.

Existing MDHHS Advisory: Yellow perch from Ski-kwe zaag'igan in Marquette County are covered under the statewide mercury guideline. No one should eat more than 4 meals per month of this species of any size.

Recommendation: No one should eat more than 4 meals per month of yellow perch of any size from Ski-kwe zaag'igan in Marquette County due to mercury.

Note: While there was a significant negative correlation between fish size and mercury concentration, it is not recommended to implement a size-based advisory unless additional data are available providing a biological reason for the negative correlation. The negative correlation for this dataset is likely due to the limited sample size.

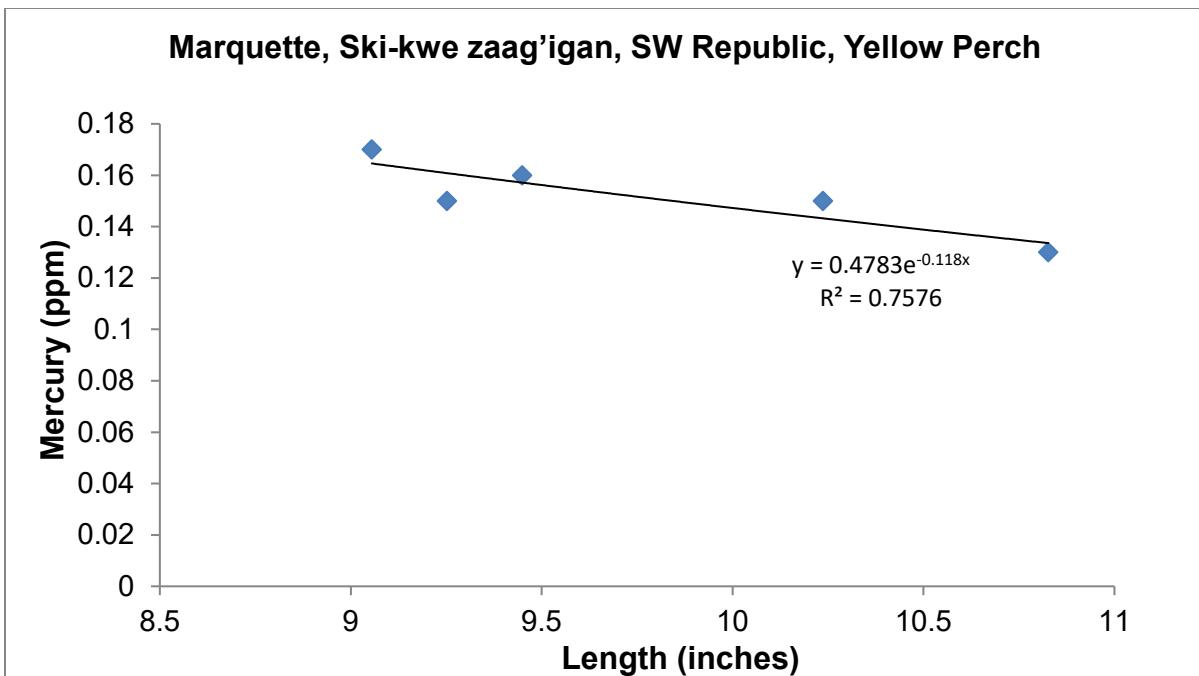

Figure 6. Relationship between fish length and mercury concentration in the edible portion of the fish.

						Final meal category based on UCL: 2

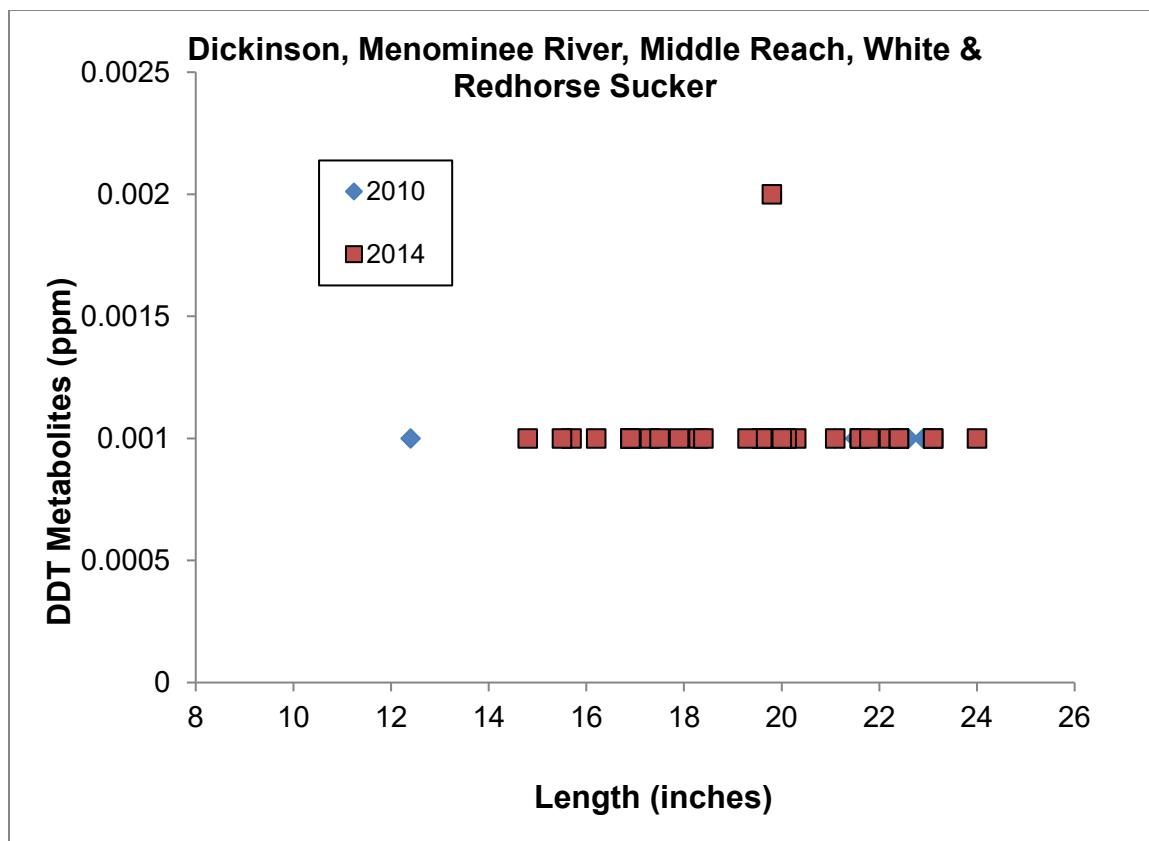

**-includes Kingsford, Big and Little Quinnesec, Sturgeon Falls, Chalk Hill, White Rapids, Grand Rapids, and Upper Scott Dam Impoundments

Existing Advisory: No one should eat more than 4 meals per month of sucker smaller than 18 inches from the Menominee River between the Twin falls and Upper Scott Dams due to PCBs and mercury, or more than 1 meal per month of those fish larger than 18 inches due to mercury.

Recommendation: No one should eat more than 2 meals per month of sucker smaller than 18 inches from the Menominee River between the Twin falls and Upper Scott Dams or more than 1 meal per month of those fish larger than 18 inches due to mercury.

Note: Although the regression no longer shows a relationship between mercury level and length, the 95% UCL Hg concentration in 18 suckers larger than 18 inches collected in 2010 and 2014 was 0.73 ppm (1 meal per month); 95% UCL Hg in 22 suckers less than 18 inches was 0.44 ppm (2 meals per month). Additional data is needed to remove the size break.

Toxaphene	--	--				
Final meal category based on UCL:						1

Existing Advisory: No one should eat more than 2 meals per month of smallmouth or largemouth bass smaller than 18 inches from Green Bay, Little Bay de Noc, or rivers tributary to those waters up to the first dam due to mercury and PCBs, or more than 1 meal per month of those fish larger than 18 inches due to mercury.

Recommendation: No one should eat more than 1 meal per month of largemouth or smallmouth bass from Green Bay or from the Menominee River up to the first dam due to mercury and PCBs.

A comparison of mercury and PCB burdens in smallmouth bass from Green Bay and Little Bay De Noc indicates that the two data sets are distinct. Separate advice should be provided for Little Bay De Noc and for Green Bay/Menominee River mouth.

Yellow Perch**Menominee River
D-S of Menominee Dam****Menominee County****Hg Analysis:**

Chlordane	--	--				
Toxaphene	--	--				
TEQ	--	--	Final meal category based on UCL: 1			

Existing Advisory: No one should eat more than 1 meal per month of northern pike smaller than 24 inches from the Michigamme River downstream of Lake Michigamme or more than 6 meals per year of those fish larger than 24 inches due to mercury.

Recommendation: No change is recommended.

Note: Recommendation diverges from standard protocol of using either UCL or regression. The few samples of large fish indicate elevated Hg concentrations in those fish despite lack of good regression line. 2014 samples included additional large fish but more sampling is needed before advice is relaxed
