Introduction

The Michigan Asthma Call-Back Survey has been conducted annually since 2005 in conjunction with the Michigan Behavioral Risk Factor Survey (MiBRFS), an annual, statewide landline and cellular telephone survey of Michigan adults aged 18 years and older. Both of these surveys are conducted through a collaborative effort among the Population Health Surveillance Branch (PHSB) at the Centers for Disease Control and Prevention (CDC), the Office for Survey Research at Michigan State University's Institute for Public Policy and Social Research, and the Michigan Department of Health and Human Services. The MiBRFS participates in the national [Behavioral Risk Factor Surveillance System](#) that is coordinated by PHSB.

Landline and cell phone respondents to the MiBRFS who had ever been diagnosed with asthma or whose randomly selected child had ever been diagnosed with asthma were asked at the end of the MiBRFS interview if they would be willing to participate in an additional interview focused on asthma. Those who agreed were called back within two weeks of the MiBRFS interview and administered a comprehensive, standardized questionnaire on asthma-related symptoms, health care, medication, and management. Two separate, but very similar, questionnaires were used: one with questions about the adult respondent with asthma and the other with questions about the selected child with asthma.

This report presents the results for children aged less than 18 years from the 2013-2017 Michigan Asthma Call-Back Surveys combined. The total 5-year sample size of completed child interviews was 514, with 140 from 2013, 91 from 2014, 90 from 2015, 110 from 2016, and 83 from 2017. Estimates were weighted to adjust for the probabilities of selection and a raking adjustment factor that adjusted for the distribution of Michigan adults by telephone source, detailed race/ethnicity, education level, marital status, age by gender, gender by race/ethnicity, age by race/ethnicity, and renter/owner status all at the state level. Analyses were performed in SAS-Callable SUDAAN®, a statistical computing program that was designed for complex sample surveys.

The prevalence estimates and 95% confidence intervals, included within the tables that follow, were restricted to children with current asthma (n=360). Current asthma was defined as a “yes” response to both of the following questions: “Have you ever been told by a doctor or other health professional that {child’s name} has asthma?” and “Does {child’s name} still have asthma?”

Table 1. Prevalence of Asthma Symptoms, Among Children Aged 0-17 Years with Current Asthma Michigan Asthma Call-Back Survey, 2013-2017 Combined				
	n^a	Had Asthma Symptoms on ≥ 9 Days in Past Month^b	Difficulty Sleeping Due to Asthma Symptoms on ≥ 2 Days in Past Month^c	Usual Activities Limited at Least a Little During Past 12 Months^d
Total	360	14.7 (10.6-20.0)	20.9 (16.0-26.8)	37.5 (31.1-44.3)
Age				
0-9 years	113	16.2 (9.5-26.2)	22.6 (14.6-33.1)	35.8 (26.0-47.0)
10-17 years	238	13.3 (8.7-19.6)	19.1 (13.4-26.6)	38.1 (29.9-46.9)
Gender
