

# Hepatitis C Virus Quarterly Surveillance Report (Quarter 3, 2023)

(Data referred 7/1/2023 through 9/30/2023—extracted 10/20/2023—Report released 10/20/2023)

This monthly report is designed to inform local health departments (LHD) of Hepatitis C Virus (HCV) cases reported to the Michigan Disease Surveillance System (MDSS) that may be related to injection drug use. These cases include all acute HCV cases and chronic HCV cases among persons aged 18 to 39. The purpose of the report is to highlight areas where transmission of HCV may be occurring among people who inject drugs. The goal is that, when warranted, this information will lead to more timely and effective public health intervention. Below are State-wide data trends. LHD-specific numbers can be found in the table that follows.

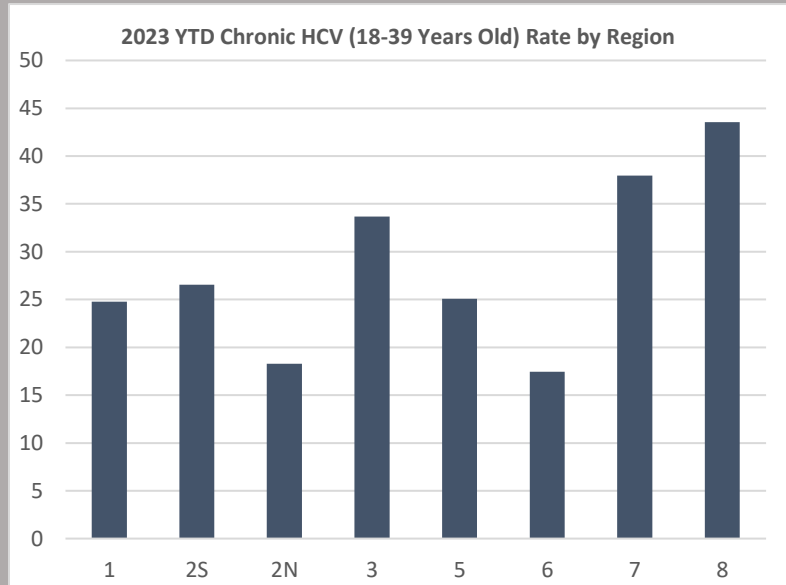

Please refer to **Technical Notes** on the final page of this document for information regarding how the data are obtained and defined, along with data limitations.

Please consider the following when interpreting trends in these data:

- 2016 Case definition change
- 2016-2017 Concurrent hepatitis A outbreak
- 2019 Reporting for negative HCV results
- 2020 COVID-19 pandemic

See technical notes for further elaboration.

Please consider the following when interpreting trends in these data:

- 2016 Case definition change
- 2019 Reporting for negative HCV results
- 2020 Case definition change
- 2020 COVID-19 pandemic

See technical notes section for further elaboration.

## Technical Notes

### Hepatitis C Virus Monthly Surveillance Report

Data in this report should be interpreted with caution and with acknowledgement of the limitations. Please direct any questions or comments regarding this report or methodology to the MDHHS Viral Hepatitis Unit ([MDHHS-Hepatitis@michigan.gov](mailto:MDHHS-Hepatitis@michigan.gov))

#### Acute and Chronic HCV Infection

- Acute HCV and Chronic HCV data are obtained from the Michigan Disease Surveillance System ([MDSS](#)).
- Only completed cases meeting [CDC/CSTE case definitions](#) are pulled for inclusion in the report. Included in the analysis are:
  - All Probable and Confirmed Acute HCV cases
  - Probable and Confirmed Chronic HCV cases between the ages of 18 and 39 years old
- Data is exported no earlier than 30 days from the end of the reporting month (e.g. January-March data is extracted no earlier than May 1<sup>st</sup>). These data are not finalized and are subject to change throughout the year.
- CDC/CSTE case definitions for [Acute](#) and [Chronic](#) HCV were significantly changed in calendar year 2016. Therefore, increases in Acute and Chronic HCV cases in 2016 reflect the change in case counting methods and not necessarily an increase in new cases.
- A rise in Acute HCV cases in 2016 and 2017 is likely due to the concurrent Hepatitis A outbreak. As clinical presentation of Hepatitis A and Hepatitis C disease is indistinguishable, symptomatic cases coinfecting with HCV and HAV were classified as both Acute HCV and HAV cases.
- In calendar year 2019, the MDSS began receiving electronic lab reports of negative HCV RNA results. Consequently, Hepatitis C cases that may have previously been reported as Probable with no HCV RNA result reported, could more accurately be classified as non-cases.
- CDC/CSTE case definitions for [Acute](#) and [Chronic](#) HCV were adjusted again in calendar year 2020. Therefore, changes in Acute and Chronic HCV cases in 2020 may reflect the change in case counting methods and not necessarily an increase or decrease in new cases.
- Due to impacts of the COVID-19 pandemic, there may be under-reporting of cases for 2020 and 2021 data.

For Acute and Chronic HCV acquisition, complete risk factor information is needed in order for MDHHS to identify trends in transmission related to injection drug use, health care transmission, and emerging risk factors. The temporality of Chronic HCV infections is often unknown due to the lack of symptoms and awareness of the time of infection. Timely and comprehensive follow-up is needed to maximize the effectiveness of this report.

#### Regional Rates and Projections

- Year to date case rates are stratified by Michigan Public Health Preparedness Regions (MPHPR). A map of the MPHPRs can be accessed here ([Regional Map](#)).
- Cases from the Michigan Department of Corrections (MDOC) are removed from regional case rates.
- Rates are calculated using Census population estimates as of July 1, 2019 (American Community Survey 5-year estimates).
- The projected number of cases in 2021 is calculated by multiplying the year to date cases by the proportion of months remaining in the year.
